

Package ‘babelgene’

October 12, 2022

Type Package

Title Gene Orthologs for Model Organisms in a Tidy Data Format

Version 22.9

Description Genomic analysis of model organisms frequently requires the use of databases based on human data or making comparisons to patient-derived resources. This requires harmonization of gene names into the same gene space. The ‘babelgene’ R package converts between human and non-human gene orthologs/homologs. The package integrates orthology assertion predictions sourced from multiple databases as compiled by the HGNC Comparison of Orthology Predictions (HCOP) (Wright et al. 2005 <[doi:10.1007/s00335-005-0103-2](https://doi.org/10.1007/s00335-005-0103-2)>, Eyre et al. 2007 <[doi:10.1093/bib/bbl030](https://doi.org/10.1093/bib/bbl030)>, Seal et al. 2011 <[doi:10.1093/nar/gkq892](https://doi.org/10.1093/nar/gkq892)>).

orthologs	<i>Retrieve gene orthologs/homologs</i>
-----------	---

Description

Retrieve gene orthologs/homologs for a set of genes. Converts between human and non-human analogs.

Usage

```
orthologs(genes, species, human = TRUE, min_support = 3, top = TRUE)
```

Arguments

genes	A vector of gene symbols or Entrez/Ensembl IDs.
species	Species name, such as <code>Mus musculus</code> or <code>mouse</code> (see <code>species()</code> for options).
human	A logical scalar indicating if the input genes are human. If <code>TRUE</code> , the input genes are human. If <code>FALSE</code> , the input genes correspond to the non-human species and the output will be the human equivalents.
min_support	Minimum number of supporting source databases. Gene pairs available in this package are supported by 2 to 12 databases (the maximum varies depending on the species).
top	For each gene, output only the match with the highest support level if there are multiple hits.

Value

A data frame of gene pairs (human and given species).

Examples

```
orthologs(genes = "TP53", species = "mouse", human = TRUE)
orthologs(genes = c("Ptprc", "Cd34"), species = "mouse", human = FALSE)
```

species	<i>Retrieve the available species</i>
---------	---------------------------------------

Description

List the species with available human orthologs.

Usage

```
species(species = NULL)
```

Arguments

species Species name, such as `Mus musculus` or `mouse`. If specified, will return results for the given species only.

Value

A data frame of the available species.

Examples

```
species()  
species("Mus musculus")  
species("mouse")  
species("rat")
```
