

# Package ‘gaussratiovegind’

June 16, 2025

**Title** Distribution of Gaussian Ratios

**Version** 2.0.3

**Maintainer** Pierre Santagostini <pierre.santagostini@institut-agro.fr>

**Description** It is well known that the distribution of a Gaussian ratio

does not follow a Gaussian distribution.

The lack of awareness among users of vegetation indices about this non-Gaussian nature could lead to incorrect statistical modeling and interpretation.

This package provides tools to accurately handle and analyse such ratios: density function, parameter estimation, simulation.

An example on the study of chlorophyll fluorescence can be found in A. El Ghaziri et al. (2023) <[doi:10.3390/rs15020528](https://doi.org/10.3390/rs15020528)>

and another method for parameter estimation is given in Bouhlel et al. (2023) <[doi:10.23919/EUSIPCO58844.2023.10290111](https://doi.org/10.23919/EUSIPCO58844.2023.10290111)>.

Statistics on Chlorophyll Fluorescence Parameters

### Description

Mean and standard deviation values on healthy and diseased tissues of chlorophyll fluorescence parameters  $F_0$  (minimum fluorescence) and  $F_m$  (maximum fluorescence) for a dataset of *Arabidopsis thaliana* plants infected with fungal pathogen data; parameters of the distribution of the ratio  $\frac{F_v}{F_m} = \frac{F_m - F_0}{F_m}$ .

### Usage

arabidopsis

### Format

A data frame with 10 rows and 6 columns:

**time** times of the acquisition of chlorophyll fluorescence images

**condition** indicates if the plant was inoculated: healthy (inoculated with water) or diseased (inoculated with the pathogen)

**mF0, sF0** Mean and standard deviation values of the chlorophyll parameter  $F_0$

**mFm, sFm** Mean and standard deviation values of the chlorophyll parameter  $F_m$

**beta, rho, delta** the  $\beta$ ,  $\rho$  and  $\delta_y$  parameters of the distribution of  $\frac{F_v}{F_m} = \frac{F_m - F_0}{F_m}$  (distributed according to a normal ratio distribution, see Details)

### Details

On each leaf picture, the  $F_0$  and  $F_m$  values are normally distributed. Hence,  $\frac{F_0}{F_m}$  is a ratio of two normal distributions.

Let  $\mu_{F_0}$  and  $\sigma_{F_0}$  the mean and standard deviation of  $F_0$  and  $\mu_{F_m}$  and  $\sigma_{F_m}$  the mean and standard deviation of  $F_m$ . The parameters  $\beta$ ,  $\rho$  and  $\delta_y$  are given by:

$$\begin{aligned}\beta &= \frac{\mu_{F_0}}{\mu_{F_m}} \\ \rho &= \frac{\sigma_{F_m}}{\sigma_{F_0}} \\ \delta_y &= \frac{\sigma_{F_m}}{\mu_{F_m}}\end{aligned}$$

dnormratio

*Density Function of a Normal Ratio Distribution*

## Description

Density of the ratio of two independent Gaussian distributions.

## Usage

```
dnormratio(z, bet, rho, delta)
```

## Arguments

`z` length  $p$  numeric vector.

`bet, rho, delta` numeric values. The parameters  $(\beta, \rho, \delta_y)$  of the distribution, see Details.

## Details

Let two independant random variables  $X \sim N(\mu_x, \sigma_x)$  and  $Y \sim N(\mu_y, \sigma_y)$ .

If we denote  $\beta = \frac{\mu_x}{\mu_y}$ ,  $\rho = \frac{\sigma_y}{\sigma_x}$  and  $\delta_y = \frac{\sigma_y}{\mu_y}$ , the probability distribution function of the ratio

$Z = \frac{X}{Y}$  is given by:

$$f_Z(z; \beta, \rho, \delta_y) = \frac{\rho}{\pi(1 + \rho^2 z^2)} \left[ \exp\left(-\frac{\rho^2 \beta^2 + 1}{2\delta_y^2}\right) + \sqrt{\frac{\pi}{2}} q \operatorname{erf}\left(\frac{q}{\sqrt{2}}\right) \exp\left(-\frac{\rho^2(z - \beta)^2}{2\delta_y^2(1 + \rho^2 z^2)}\right) \right]$$

$$\text{with } q = \frac{1 + \beta \rho^2 z}{\delta_y \sqrt{1 + \rho^2 z^2}} \text{ and } \operatorname{erf}\left(\frac{q}{\sqrt{2}}\right) = \frac{2}{\sqrt{\pi}} \int_0^{\frac{q}{\sqrt{2}}} \exp(-t^2) dt$$

Another expression of this density, used by the `estparnormratio()` function, is:

$$f_Z(z; \beta, \rho, \delta_y) = \frac{\rho}{\pi(1 + \rho^2 z^2)} \exp\left(-\frac{\rho^2 \beta^2 + 1}{2\delta_y^2}\right) {}_1F_1\left(1, \frac{1}{2}; \frac{1}{2\delta_y^2} \frac{(1 + \beta\rho^2 z)^2}{1 + \rho^2 z^2}\right)$$

where  ${}_1F_1(a, b; x)$  is the confluent hypergeometric function (Kummer's function):

$${}_1F_1(a, b; x) = \sum_{n=0}^{+\infty} \frac{(a)_n}{(b)_n} \frac{x^n}{n!}$$

## Value

Numeric: the value of density.

## Author(s)

Pierre Santagostini, Angélina El Ghaziri, Nizar Bouhlel

## Examples

```
# First example
beta1 <- 0.15
rho1 <- 5.75
delta1 <- 0.22
dnormratio(0, bet = beta1, rho = rho1, delta = delta1)
dnormratio(0.5, bet = beta1, rho = rho1, delta = delta1)
curve(dnormratio(x, bet = beta1, rho = rho1, delta = delta1), from = -0.1, to = 0.7)

# Second example
beta2 <- 2
rho2 <- 2
delta2 <- 2
dnormratio(0, bet = beta2, rho = rho2, delta = delta2)
```

```
dnormratio(0.5, bet = beta2, rho = rho2, delta = delta2)
curve(dnormratio(x, bet = beta2, rho = rho2, delta = delta2), from = -0.1, to = 0.7)
```

---

**estparnormratio***Estimation of the Parameters of a Normal Ratio Distribution***Description**

Estimation of the parameters of a ratio  $Z = \frac{X}{Y}$ ,  $X$  and  $Y$  being two independent random variables distributed according to Gaussian distributions, using the EM (estimation-maximization) algorithm or variational inference. Depending on the estimation method, the `estparnormratio` function calls `estparEM` (EM algorithm) or `estparVB` (variational Bayes).

**Usage**

```
estparnormratio(z, method = c("EM", "VB"), eps = 1e-06,
                 display = FALSE, mux0 = 1, sigmax0 = 1,
                 alphax0 = NULL, betax0 = NULL, muy0 = 1, sigmay0 = 1,
                 alphay0 = NULL, betay0 = NULL)

estparEM(z, eps = 1e-06, display = FALSE, #plot = display,
         mux0 = 1, sigmax0 = 1, muy0 = 1, sigmay0 = 1)

estparVB(z, eps = 1e-06, display = FALSE, mux0 = 1, sigmax0 = 1,
          alphax0 = 1, betax0 = 1, muy0 = 1, sigmay0 = 1,
          alphay0 = 1, betay0 = 1)

estparEM(
  z,
  eps = 1e-06,
  display = FALSE,
  mux0 = 1,
  sigmax0 = 1,
  muy0 = 1,
  sigmay0 = 1
)

estparVB(
  z,
  eps = 1e-06,
  display = FALSE,
  mux0 = 1,
  sigmax0 = 1,
  alphax0 = 1,
  betax0 = 1,
  muy0 = 1,
```

```

sigmay0 = 1,
alphay0 = 1,
betay0 = 1
)

```

## Arguments

<code>z</code>	numeric.
<code>method</code>	the method used to estimate the parameters of the distribution. It can be "EM" (expectation-maximization) or "VB" (Variational Bayes).
<code>eps</code>	numeric. Precision for the estimation of the parameters (see Details).
<code>display</code>	logical. When TRUE the successive values of the stop criterion (distance between successive values) is printed.
<code>mux0, sigmax0, muy0, sigmay0</code>	initial values of the means and standard deviations of the $X$ and $Y$ variables. Default: <code>mux0 = 1, sigmax0 = 1, muy0 = 1, sigmay0 = 1</code> .
<code>alphax0, betax0, alphay0, betay0</code>	initial values for the variational Bayes method. Omitted if <code>method="EM"</code> . If <code>method="VB"</code> , if omitted, they are set to 1.

## Details

Let a random variable:  $Z = \frac{X}{Y}$ ,

$X$  and  $Y$  being normally distributed:  $X \sim N(\mu_x, \sigma_x)$  and  $Y \sim N(\mu_y, \sigma_y)$ .

The density probability of  $Z$  is:

$$f_Z(z; \beta, \rho, \delta_y) = \frac{\rho}{\pi(1 + \rho^2 z^2)} \exp\left(-\frac{\rho^2 \beta^2 + 1}{2\delta_y^2}\right) {}_1F_1\left(1, \frac{1}{2}; \frac{1}{2\delta_y^2} \frac{(1 + \beta\rho^2 z)^2}{1 + \rho^2 z^2}\right)$$

with:  $\beta = \frac{\mu_x}{\mu_y}$ ,  $\rho = \frac{\sigma_y}{\sigma_x}$ ,  $\delta_y = \frac{\sigma_y}{\mu_y}$ .

and  ${}_1F_1(a, b; x)$  is the confluent hypergeometric function (Kummer's function):

$${}_1F_1(a, b; x) = \sum_{n=0}^{+\infty} \frac{(a)_n}{(b)_n} \frac{x^n}{n!}$$

If `method = "EM"`, the means and standard deviations  $\mu_x$ ,  $\sigma_x$ ,  $\mu_y$  and  $\sigma_y$  are estimated with the EM algorithm, as presented in El Ghaziri et al. If `method = "VB"`, they are estimated with the variational Bayes method as presented in Bouhlel et al.

Then the parameters  $\beta$ ,  $\rho$ ,  $\delta_y$  of the  $Z$  distribution are computed from these means and standard deviations.

The estimation of  $\mu_x$ ,  $\sigma_x$ ,  $\mu_y$  and  $\sigma_y$  uses an iterative algorithm. The precision for their estimation is given by the `eps` parameter.

The computation uses the [kummer](#) function.

If there are ties in the `z` vector, it generates a warning, as there should be no ties in data distributed among a continuous distribution.

**Value**

A list of 3 elements `beta`, `rho`, `delta`: the estimated parameters of the  $Z$  distribution  $\hat{\beta}$ ,  $\hat{\rho}$ ,  $\hat{\delta}_y$ , with three attributes `attr(, "epsilon")` (precision of the result), `attr(, "k")` (number of iterations) and `attr(, "method")` (estimation method).

```

---

**kummer***Confluent D-Hypergeometric Function***Description**

Computes the Kummer's function, or confluent hypergeometric function.

**Usage**

```
kummer(a, b, z, eps = 1e-06)
```

**Arguments**

a	numeric.
b	numeric
z	numeric vector.
eps	numeric. Precision for the sum (default 1e-06).

**Details**

The Kummer's confluent hypergeometric function is given by:

$${}_1F_1(a, b; z) = \sum_{n=0}^{+\infty} \frac{(a)_n}{(b)_n} \frac{z^n}{n!}$$

where  $(z)_p$  is the Pochhammer symbol (see [pochhammer](#)).

The `eps` argument gives the required precision for its computation. It is the `attr(, "epsilon")` attribute of the returned value.

**Value**

A numeric value: the value of the Kummer's function, with two attributes `attr(, "epsilon")` (precision of the result) and `attr(, "k")` (number of iterations).

**Inpochhammer***Logarithm of the Pochhammer Symbol*

---

## Description

Computes the logarithm of the Pochhammer symbol.

## Usage

```
Inpochhammer(x, n)
```

## Arguments

x	numeric.
n	positive integer.

## Details

The Pochhammer symbol is given by:

$$(x)_n = \frac{\Gamma(x+n)}{\Gamma(x)} = x(x+1)\dots(x+n-1)$$

So, if  $n > 0$ :

$$\log((x)_n) = \log(x) + \log(x+1) + \dots + \log(x+n-1)$$

If  $n = 0$ ,  $\log((x)_n) = \log(1) = 0$

## Value

Numeric value. The logarithm of the Pochhammer symbol.

## Author(s)

Pierre Santagostini, Nizar Bouhlel

## See Also

## Examples

```
Inpochhammer(2, 0)
Inpochhammer(2, 1)
Inpochhammer(2, 3)
```

pnormratio

*Cumulative Distribution of a Normal Ratio Distribution***Description**

Cumulative distribution of the ratio of two independent Gaussian distributions.

**Usage**

```
pnormratio(z, bet, rho, delta)
```

**Arguments**

- |                              |  |
|------------------------------|--|
| <code>z</code>               | length $p$ vector of quantiles.  |
| <code>bet, rho, delta</code> | numeric values. The parameters $(\beta, \rho, \delta_y)$ of the distribution, see Details. |

**Details**

Let two independant random variables  $X \sim N(\mu_x, \sigma_x)$  and  $Y \sim N(\mu_y, \sigma_y)$ .

If we denote  $f_Z(z; \beta, \rho, \delta_y)$  the probability distribution function of the ratio  $Z = \frac{X}{Y}$ , with  $\beta = \frac{\mu_x}{\mu_y}$ ,  $\rho = \frac{\sigma_y}{\sigma_x}$  and  $\delta_y = \frac{\sigma_y}{\mu_y}$  (see [dnormratio\(\)](#), Details section).

The probability distribution for  $Z$  is given by:

$$F(z; \beta, \rho, \delta_y) = \int_{-\infty}^z f_Z(z; \beta, \rho, \delta_y) dz$$

This integral is computed using numerical integration.

**Value**

Numeric: the value of density.

rho1 <- 5.75
delta1 <- 0.22
pnormratio(0, bet = beta1, rho = rho1, delta = delta1)
pnormratio(0.5, bet = beta1, rho = rho1, delta = delta1)
curve(pnormratio(x, bet = beta1, rho = rho1, delta = delta1), from = -0.1, to = 0.7)

# Second example
beta2 <- 2
rho2 <- 2
delta2 <- 2
pnormratio(0, bet = beta2, rho = rho2, delta = delta2)
pnormratio(0.5, bet = beta2, rho = rho2, delta = delta2)
curve(pnormratio(x, bet = beta2, rho = rho2, delta = delta2), from = -0.1, to = 0.7)
```

**Description**

Computes the Pochhammer symbol.

**Usage**

```
pochhammer(x, n)
```

**Arguments**

x	numeric.
n	positive integer.

**Details**

The Pochhammer symbol is given by:

$$(x)_n = \frac{\Gamma(x+n)}{\Gamma(x)} = x(x+1)\dots(x+n-1)$$

**Value**

Numeric value. The value of the Pochhammer symbol.

**Examples**

```
pochhammer(2, 0)
pochhammer(2, 1)
pochhammer(2, 3)
```

**rnormratio**

*Simulate from a Normal Ratio Distribution*

**Description**

Simulate data from a ratio of two independent Gaussian distributions.

**Usage**

```
rnormratio(n, bet, rho, delta)
```

**Arguments**

- n integer. Number of observations. If `length(n) > 1`, the length is taken to be the number required.
- bet, rho, delta numeric values. The parameters  $(\beta, \rho, \delta_y)$  of the distribution, see Details.

**Details**

Let two random variables  $X \sim N(\mu_x, \sigma_x)$  and  $Y \sim N(\mu_y, \sigma_y)$

with probability densities  $f_X$  and  $f_Y$ .

The parameters of the distribution of the ratio  $Z = \frac{X}{Y}$  are:  $\beta = \frac{\mu_x}{\mu_y}$ ,  $\rho = \frac{\sigma_y}{\sigma_x}$ ,  $\delta_y = \frac{\sigma_y}{\mu_y}$ .

$\mu_x$ ,  $\sigma_x$ ,  $\mu_y$  and  $\sigma_y$  are computed from  $\beta$ ,  $\rho$  and  $\delta_y$  (by fixing arbitrarily  $\mu_x = 1$ ) and two random samples  $(x_1, \dots, x_n)$  and  $(y_1, \dots, y_n)$  are simulated.

Then  $\left(\frac{x_1}{y_1}, \dots, \frac{x_n}{y_n}\right)$  is returned.

**Value**

A numeric vector: the produced sample.
