Package 'vtreat'

June 12, 2024

Type Package

Title A Statistically Sound 'data.frame' Processor/Conditioner

Version 1.6.5

Date 2024-06-12

URL https://github.com/WinVector/vtreat/, https://winvector.github.io/vtreat/

BugReports https://github.com/WinVector/vtreat/issues

Maintainer John Mount <jmount@win-vector.com>

Description A 'data.frame' processor/conditioner that prepares realworld data for predictive modeling in a statistically sound manner. 'vtreat' prepares variables so that data has fewer exceptional cases, making it easier to safely use models in production. Common problems 'vtreat' defends against: 'Inf', 'NA', too many categorical levels, rare categorical levels, and new categorical levels (levels seen during application, but not during training). Reference: ```vtreat': a data.frame Processor for Predictive Model-

ing", Zumel, Mount, 2016, <DOI:10.5281/zenodo.1173313>.

vtreat: A Statistically Sound 'data.frame' Processor/Conditioner

Description

A 'data.frame' processor/conditioner that prepares real-world data for predictive modeling in a statistically sound manner. 'vtreat' prepares variables so that data has fewer exceptional cases, making it easier to safely use models in production. Common problems 'vtreat' defends against: 'Inf', 'NA', too many categorical levels, rare categorical levels, and new categorical levels (levels seen during application, but not during training). 'vtreat::prepare' should be used as you would use 'model.matrix'.

apply_transform Transform second argument by first.

Description

Apply first argument to second as a transform.

Usage

apply_transform(vps, dframe, ..., parallelCluster = NULL)

Arguments

vps	vtreat pipe step, object defining transform.
dframe	data.frame, data to transform
	not used, forces later arguments to bind by name.
parallelCluster	
	optional, parallel cluster to run on.

Value

transformed dframe

as_rquery_plan Convert vtreatment plans into a sequence of rquery operations.

Description

Convert vtreatment plans into a sequence of rquery operations.

Usage

```
as_rquery_plan(treatmentplans, ..., var_restriction = NULL)
```

as_rquery_plan

Arguments

treatmentplans	vtreat treatment plan or list of vtreat treatment plan sharing same outcome and	
	outcome type.	
	not used, force any later arguments to bind to names.	
var_restriction		
	character, if not null restrict to producing these variables.	

Value

list(optree_generator (ordered list of functions), temp_tables (named list of tables))

See Also

rquery_prepare

```
if(requireNamespace("rquery", quietly = TRUE)) {
   dTrainC <- data.frame(x= c('a', 'a', 'a', 'b' ,NA , 'b'),</pre>
                          z= c(1, 2, NA, 4, 5, 6),
                          y= c(FALSE, FALSE, TRUE, FALSE, TRUE, TRUE),
                          stringsAsFactors = FALSE)
   dTrainC$id <- seq_len(nrow(dTrainC))</pre>
   treatmentsC <- designTreatmentsC(dTrainC, c("x", "z"), 'y', TRUE)</pre>
   print(prepare(treatmentsC, dTrainC))
   rqplan <- as_rquery_plan(list(treatmentsC))</pre>
   ops <- flatten_fn_list(rquery::local_td(dTrainC), rqplan$optree_generators)</pre>
   cat(format(ops))
   if(requireNamespace("rqdatatable", quietly = TRUE)) {
      treated <- rqdatatable::ex_data_table(ops, tables = rqplan$tables)</pre>
      print(treated[])
   }
   if(requireNamespace("DBI", quietly = TRUE) &&
      requireNamespace("RSQLite", quietly = TRUE)) {
      db <- DBI::dbConnect(RSQLite::SQLite(), ":memory:")</pre>
      source_data <- rquery::rq_copy_to(db, "dTrainC", dTrainC,</pre>
                                overwrite = TRUE, temporary = TRUE)
      rest <- rquery_prepare(db, rqplan, source_data, "dTreatedC",</pre>
                                    extracols = "id")
      resd <- DBI::dbReadTable(db, rest$table_name)</pre>
      print(resd)
      rquery::rq_remove_table(db, source_data$table_name)
      rquery::rq_remove_table(db, rest$table_name)
      DBI::dbDisconnect(db)
   }
}
```

```
BinomialOutcomeTreatment
```

Stateful object for designing and applying binomial outcome treatments.

Description

Hold settings and results for binomial classification data preparation.

Usage

```
BinomialOutcomeTreatment(
    ...,
    var_list,
    outcome_name,
    outcome_target = TRUE,
    cols_to_copy = NULL,
    params = NULL,
    imputation_map = NULL
)
```

Arguments

	not used, force arguments to be specified by name.
var_list	Names of columns to treat (effective variables).
outcome_name	Name of column holding outcome variable. dframe[[outcomename]] must be only finite and non-missing values.
outcome_target	Value/level of outcome to be considered "success", and there must be a cut such that dframe[[outcomename]]==outcometarget at least twice and dframe[[outcomename]]!=outcometar at least twice.
cols_to_copy	list of extra columns to copy.
params	parameters list from classification_parameters
<pre>imputation_map</pre>	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Details

Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_ transform_api.md, mkCrossFrameCExperiment, designTreatmentsC, and prepare.treatmentplan for details. buildEvalSets

Description

Return a carve-up of seq_len(nRows). Very useful for any sort of nested model situation (such as data prep, stacking, or super-learning).

Usage

```
buildEvalSets(
    nRows,
    ...,
    dframe = NULL,
    y = NULL,
    splitFunction = NULL,
    nSplits = 3
)
```

Arguments

nRows	scalar, $>=1$ number of rows to sample from.
	no additional arguments, declared to forced named binding of later arguments.
dframe	(optional) original data.frame, passed to user splitFunction.
У	(optional) numeric vector, outcome variable (possibly to stratify on), passed to user splitFunction.
splitFunction	(optional) function taking arguments nSplits,nRows,dframe, and y; returning a user desired split.
nSplits	integer, target number of splits.

Details

Also sets attribute "splitmethod" on return value that describes how the split was performed. attr(returnValue,'splitmethod') is one of: 'notsplit' (data was not split; corner cases like single row data sets), 'oneway' (leave one out holdout), 'kwaycross' (a simple partition), 'userfunction' (user supplied function was actually used), or a user specified attribute. Any user desired properties (such as stratification on y, or preservation of groups designated by original data row numbers) may not apply unless you see that 'userfunction' has been used.

The intent is the user splitFunction only needs to handle "easy cases" and maintain user invariants. If the user splitFunction returns NULL, throws, or returns an unacceptable carve-up then vtreat::buildEvalSets returns its own eval set plan. The signature of splitFunction should be split-Function(nRows,nSplits,dframe,y) where nSplits is the number of pieces we want in the carve-up, nRows is the number of rows to split, dframe is the original dataframe (useful for any group control variables), and y is a numeric vector representing outcome (useful for outcome stratification).

Note that buildEvalSets may not always return a partition (such as one row dataframes), or if the user split function chooses to make rows eligible for application a different number of times.

Value

list of lists where the app portion of the sub-lists is a disjoint carve-up of seq_len(nRows) and each list as a train portion disjoint from app.

```
# use
buildEvalSets(200)
# longer example
# helper fns
# fit models using experiment plan to estimate out of sample behavior
fitModelAndApply <- function(trainData,applicaitonData) {</pre>
   model <- lm(y~x,data=trainData)</pre>
   predict(model,newdata=applicaitonData)
}
simulateOutOfSampleTrainEval <- function(d,fitApplyFn) {</pre>
   eSets <- buildEvalSets(nrow(d))</pre>
   evals <- lapply(eSets,</pre>
      function(ei) { fitApplyFn(d[ei$train,],d[ei$app,]) })
   pred <- numeric(nrow(d))</pre>
   for(eii in seq_len(length(eSets))) {
     pred[eSets[[eii]]$app] <- evals[[eii]]</pre>
   }
   pred
}
# run the experiment
set.seed(2352356)
# example data
d <- data.frame(x=rnorm(5),y=rnorm(5),</pre>
        outOfSampleEst=NA, inSampleEst=NA)
# fit model on all data
d$inSampleEst <- fitModelAndApply(d,d)
# compute in-sample R^2 (above zero, falsely shows a
#
    relation until we adjust for degrees of freedom)
1-sum((d$y-d$inSampleEst)^2)/sum((d$y-mean(d$y))^2)
d$outOfSampleEst <- simulateOutOfSampleTrainEval(d,fitModelAndApply)</pre>
# compute out-sample R^2 (not positive,
# evidence of no relation)
1-sum((d$y-d$outOfSampleEst)^2)/sum((d$y-mean(d$y))^2)
```

center_scale

Description

Center and scale a set of variables. Other columns are passed through.

Usage

```
center_scale(d, center, scale)
```

Arguments

d	data.frame to work with
center	named vector of variables to center
scale	named vector of variables to scale

Value

d with centered and scaled columns altered

Examples

classification_parameters

vtreat classification parameters.

Description

A list of settings and values for vtreat binomial classification fitting. Please see https://github. com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, mkCrossFrameCExperiment, designTreatmentsC, and prepare.treatmentplan for details.

Usage

classification_parameters(user_params = NULL)

Arguments

user_params list of user overrides.

Value

filled out parameter list

designTreatmentsC Build all treatments for a data frame to predict a categorical outcome.

Description

Function to design variable treatments for binary prediction of a categorical outcome. Data frame is assumed to have only atomic columns except for dates (which are converted to numeric). Note: re-encoding high cardinality categorical variables can introduce undesirable nested model bias, for such data consider using mkCrossFrameCExperiment.

Usage

```
designTreatmentsC(
 dframe,
  varlist,
 outcomename,
 outcometarget = TRUE,
  ...,
 weights = c(),
 minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = NULL,
  collarProb = 0,
  codeRestriction = NULL,
  customCoders = NULL,
  splitFunction = NULL,
  ncross = 3,
  forceSplit = FALSE,
  catScaling = TRUE,
  verbose = TRUE,
  parallelCluster = NULL,
  use_parallel = TRUE,
 missingness_imputation = NULL,
  imputation_map = NULL
```

)

designTreatmentsC

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values.
outcometarget	Value/level of outcome to be considered "success", and there must be a cut such that dframe[[outcomename]]==outcometarget at least twice and dframe[[outcomename]]!=outcometarget at least twice.
	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan.
codeRestriction	
	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	<pre>map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders. md).</pre>
splitFunction	(optional) see vtreat::buildEvalSets .
ncross	optional scalar >=2 number of cross validation splits use in rescoring complex variables.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.
verbose	if TRUE print progress.
parallelCluster	
	(optional) a cluster object created by package parallel or package snow.
use_parallel	logical, if TRUE use parallel methods (when parallel cluster is set).
missingness_imp	utation function of signature f(values: numeric, weights: numeric), simple missing value imputer.
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Details

The main fields are mostly vectors with names (all with the same names in the same order):

- vars : (character array without names) names of variables (in same order as names on the other diagnostic vectors) - varMoves : logical TRUE if the variable varied during hold out scoring, only variables that move will be in the treated frame - #' - sig : an estimate significance of effect

See the vtreat vignette for a bit more detail and a worked example.

Columns that do not vary are not passed through.

Note: re-encoding high cardinality on training data can introduce nested model bias, consider using mkCrossFrameCExperiment instead.

Value

treatment plan (for use with prepare)

See Also

prepare.treatmentplan, designTreatmentsN, designTreatmentsZ, mkCrossFrameCExperiment

Examples

```
dTrainC <- data.frame(x=c('a','a','a','b','b','b'),
    z=c(1,2,3,4,5,6),
    y=c(FALSE,FALSE,TRUE,FALSE,TRUE,TRUE))
dTestC <- data.frame(x=c('a','b','c',NA),
    z=c(10,20,30,NA))
treatmentsC <- designTreatmentsC(dTrainC,colnames(dTrainC),'y',TRUE)
dTestCTreated <- prepare(treatmentsC,dTestC,pruneSig=0.99)</pre>
```

designTreatmentsN build all treatments for a data frame to predict a numeric outcome

Description

Function to design variable treatments for binary prediction of a numeric outcome. Data frame is assumed to have only atomic columns except for dates (which are converted to numeric). Note: each column is processed independently of all others. Note: re-encoding high cardinality on training data categorical variables can introduce undesirable nested model bias, for such data consider using mkCrossFrameNExperiment.

Usage

```
designTreatmentsN(
   dframe,
   varlist,
   outcomename,
```

12

designTreatmentsN

```
· · · ,
weights = c(),
minFraction = 0.02,
smFactor = 0,
rareCount = 0,
rareSig = NULL,
collarProb = 0,
codeRestriction = NULL,
customCoders = NULL,
splitFunction = NULL,
ncross = 3,
forceSplit = FALSE,
verbose = TRUE,
parallelCluster = NULL,
use_parallel = TRUE,
missingness_imputation = NULL,
imputation_map = NULL
```

Arguments

)

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values and there must be a cut such that dframe[[outcomename]] is both above the cut at least twice and below the cut at least twice.
	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan.
codeRestrictior	1
	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	<pre>map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders md).</pre>
splitFunction	(optional) see vtreat::buildEvalSets .

ncross	optional scalar >=2 number of cross validation splits use in rescoring complex variables.	
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.	
verbose	if TRUE print progress.	
parallelCluster		
	(optional) a cluster object created by package parallel or package snow.	
use_parallel	logical, if TRUE use parallel methods (when parallel cluster is set).	
missingness_imputation		
	function of signature f(values: numeric, weights: numeric), simple missing value imputer.	
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.	

Details

The main fields are mostly vectors with names (all with the same names in the same order):

- vars : (character array without names) names of variables (in same order as names on the other diagnostic vectors) - varMoves : logical TRUE if the variable varied during hold out scoring, only variables that move will be in the treated frame - sig : an estimate significance of effect

See the vtreat vignette for a bit more detail and a worked example.

Columns that do not vary are not passed through.

Value

treatment plan (for use with prepare)

See Also

prepare.treatmentplan,designTreatmentsC,designTreatmentsZ,mkCrossFrameNExperiment

```
dTrainN <- data.frame(x=c('a', 'a', 'a', 'a', 'b', 'b', 'b'),
        z=c(1,2,3,4,5,6,7),y=c(0,0,0,1,0,1,1))
dTestN <- data.frame(x=c('a', 'b', 'c',NA),
        z=c(10,20,30,NA))
treatmentsN = designTreatmentsN(dTrainN,colnames(dTrainN), 'y')
dTestNTreated <- prepare(treatmentsN,dTestN,pruneSig=0.99)</pre>
```

designTreatmentsZ Design variable treatments with no outcome variable.

Description

Data frame is assumed to have only atomic columns except for dates (which are converted to numeric). Note: each column is processed independently of all others.

Usage

```
designTreatmentsZ(
  dframe,
  varlist,
  . . . ,
 minFraction = 0,
 weights = c(),
  rareCount = 0,
  collarProb = 0,
  codeRestriction = NULL,
  customCoders = NULL,
  verbose = TRUE,
  parallelCluster = NULL,
  use_parallel = TRUE,
 missingness_imputation = NULL,
  imputation_map = NULL
)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
•••	no additional arguments, declared to forced named binding of later arguments
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
weights	optional training weights for each row
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan.
codeRestriction	
	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	<pre>map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders. md).</pre>

verbose	if TRUE print progress.	
parallelCluster		
	(optional) a cluster object created by package parallel or package snow.	
use_parallel	logical, if TRUE use parallel methods (if parallel cluster is set).	
missingness_imputation		
	function of signature f(values: numeric, weights: numeric), simple missing value imputer.	
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.	

Details

The main fields are mostly vectors with names (all with the same names in the same order):

- vars : (character array without names) names of variables (in same order as names on the other diagnostic vectors) - varMoves : logical TRUE if the variable varied during hold out scoring, only variables that move will be in the treated frame

See the vtreat vignette for a bit more detail and a worked example.

Columns that do not vary are not passed through.

Value

treatment plan (for use with prepare)

See Also

prepare.treatmentplan,designTreatmentsC,designTreatmentsN

Examples

```
dTrainZ <- data.frame(x=c('a','a','a','a','b','b',NA,'e','e'),
    z=c(1,2,3,4,5,6,7,NA,9))
dTestZ <- data.frame(x=c('a','x','c',NA),
    z=c(10,20,30,NA))
treatmentsZ = designTreatmentsZ(dTrainZ, colnames(dTrainZ),
    rareCount=0)
dTrainZTreated <- prepare(treatmentsZ, dTrainZ)
dTestZTreated <- prepare(treatmentsZ, dTestZ)</pre>
```

 ${\tt design_missingness_treatment}$

Design a simple treatment plan to indicate missingingness and perform simple imputation.

Description

Design a simple treatment plan to indicate missingingness and perform simple imputation.

design_missingness_treatment

Usage

```
design_missingness_treatment(
   dframe,
    ...,
   varlist = colnames(dframe),
   invalid_mark = "_invalid_",
   drop_constant_columns = FALSE,
   missingness_imputation = NULL,
   imputation_map = NULL
)
```

Arguments

dframe	data.frame to drive design.	
	not used, forces later arguments to bind by name.	
varlist	character, names of columns to process.	
invalid_mark	character, name to use for NA levels and novel levels.	
drop_constant_columns		
	logical, if TRUE drop columns that do not vary from the treatment plan.	
missingness_imputation		
	function of signature f(values: numeric), simple missing value imputer.	
imputation_map	map from column names to functions of signature f(values: numeric), simple missing value imputers.	

Value

simple treatment plan.

See Also

prepare.simple_plan

Examples

```
d <- wrapr::build_frame(
    "x1", "x2", "x3" |
    1 , 4 , "A" |
    NA , 5 , "B" |
    3 , 6 , NA )
plan <- design_missingness_treatment(d)
prepare(plan, d)</pre>
```

prepare(plan, data.frame(x1=NA, x2=NA, x3="E"))

Description

Update the state of first argument to have learned or fit from second argument.

Usage

```
fit(vps, dframe, ..., weights = NULL, parallelCluster = NULL)
```

Arguments

vps	vtreat pipe step, object specifying fit
dframe	data.frame, data to fit from.
	not used, forces later arguments to bind by name.
weights	optional, per-dframe data weights.
parallelCluste	r
	optional, parallel cluster to run on.

Details

Note: input vps is not altered, fit is in returned value.

Value

new fit object

fit_prepare

Fit and prepare in a cross-validated manner.

Description

Update the state of first argument to have learned or fit from second argument, and compute a cross validated example of such a transform.

Usage

fit_prepare(vps, dframe, ..., weights = NULL, parallelCluster = NULL)

fit

fit_transform

Arguments

vps	vtreat pipe step, object specifying fit.
dframe	data.frame, data to fit from.
	not used, forces later arguments to bind by name.
weights	optional, per-dframe data weights.
parallelCluste	r
	optional, parallel cluster to run on.

Details

Note: input vps is not altered, fit is in returned list.

Value

@return named list containing: treatments and cross_frame

fit_transform	Fit and transform in a cross-validated manner.

Description

Update the state of first argument to have learned or fit from second argument, and compute a cross validated example of such a transform.

Usage

```
fit_transform(vps, dframe, ..., weights = NULL, parallelCluster = NULL)
```

Arguments

vps	vtreat pipe step, object specifying fit.
dframe	data.frame, data to fit from.
	not used, forces later arguments to bind by name.
weights	optional, per-dframe data weights.
parallelCluster	-
	optional, parallel cluster to run on.

Details

Note: input vps is not altered, fit is in returned list.

Value

@return named list containing: treatments and cross_frame

format.vtreatment Display treatment plan.

Description

Display treatment plan.

Usage

S3 method for class 'vtreatment'
format(x, ...)

Arguments

х	treatment plan
	additional args (to match general signature).

getSplitPlanAppLabels read application labels off a split plan.

Description

read application labels off a split plan.

Usage

```
getSplitPlanAppLabels(nRow, plan)
```

Arguments

nRow	number of rows in original data.frame.
plan	split plan

Value

vector of labels

See Also

kWay CrossValidation, kWay Stratified Y, and makek Way CrossValidation Grouped By Column

```
plan <- kWayStratifiedY(3,2,NULL,NULL)
getSplitPlanAppLabels(3,plan)</pre>
```

Description

Return previously fit feature names.

Usage

```
get_feature_names(vps)
```

Arguments

vps vtreat pipe step, mutable object to read from.

Value

feature names

get_score_frame *Return score frame from vps.*

Description

Return previously fit score frame.

Usage

get_score_frame(vps)

Arguments

vps vtreat pipe step, mutable object to read from.

Value

score frame

get_transform

Description

Return previously fit transform.

Usage

get_transform(vps)

Arguments

vps

vtreat pipe step, mutable object to read from.

Value

transform

kWayCrossValidation	k-fold	cross	validation,	a	splitFunction	in	the	sense	of
	vtreat:	:buildEv	valSets						

Description

k-fold cross validation, a splitFunction in the sense of vtreat::buildEvalSets

Usage

kWayCrossValidation(nRows, nSplits, dframe, y)

Arguments

nRows	number of rows to split (>1).
nSplits	number of groups to split into (>1,<=nRows).
dframe	original data frame (ignored).
У	numeric outcome variable (ignored).

Value

split plan

Examples

kWayCrossValidation(7,2,NULL,NULL)

kWayStratifiedY k-fold cross validation stratified on y, a splitFunction in the sense of vtreat::buildEvalSets

Description

k-fold cross validation stratified on y, a splitFunction in the sense of vtreat::buildEvalSets

Usage

```
kWayStratifiedY(nRows, nSplits, dframe, y)
```

Arguments

nRows	number of rows to split (>1)
nSplits	number of groups to split into (<nrows,>1).</nrows,>
dframe	original data frame (ignored).
У	numeric outcome variable try to have equidistributed in each split.

Value

split plan

```
set.seed(23255)
d <- data.frame(y=sin(1:100))
pStrat <- kWayStratifiedY(nrow(d),5,d,d$y)
problemAppPlan(nrow(d),5,pStrat,TRUE)
d$stratGroup <- vtreat::getSplitPlanAppLabels(nrow(d),pStrat)
pSimple <- kWayCrossValidation(nrow(d),5,d,d$y)
problemAppPlan(nrow(d),5,pSimple,TRUE)
d$simpleGroup <- vtreat::getSplitPlanAppLabels(nrow(d),pSimple)
summary(tapply(d$y,d$simpleGroup,mean))
summary(tapply(d$y,d$stratGroup,mean))
```

```
kWayStratifiedYReplace
```

k-fold cross validation stratified with replacement on y, a splitFunction in the sense of vtreat::buildEvalSets.

Description

Build a k-fold cross validation sample where training sets are the same size as the original data, and built by sampling disjoint from test/application sets (sampled with replacement).

Usage

```
kWayStratifiedYReplace(nRows, nSplits, dframe, y)
```

Arguments

nRows	number of rows to split (>1)
nSplits	number of groups to split into (<nrows,>1).</nrows,>
dframe	original data frame (ignored).
У	numeric outcome variable try to have equidistributed in each split.

Value

split plan

Examples

```
set.seed(23255)
d <- data.frame(y=sin(1:100))
pStrat <- kWayStratifiedYReplace(nrow(d),5,d,d$y)</pre>
```

makeCustomCoderCat *Make a categorical input custom coder.*

Description

Make a categorical input custom coder.

makeCustomCoderNum

Usage

```
makeCustomCoderCat(
    ...,
    customCode,
    coder,
    codeSeq,
    v,
    vcolin,
    zoY,
    zC,
    zTarget,
    weights = NULL,
    catScaling = FALSE
)
```

Arguments

	not used, force arguments to be set by name
customCode	code name
coder	user supplied variable re-coder (see vignette for type signature)
codeSeq	argments to custom coder
v	variable name
vcolin	data column, character
zoY	outcome column as numeric
zC	if classification outcome column as character
zTarget	if classification target class
weights	per-row weights
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.

Value

wrapped custom coder

makeCustomCoderNum Make a numeric input custom coder.

Description

Make a numeric input custom coder.

Usage

makeCustomCoderNum(

```
...,
customCode,
coder,
codeSeq,
v,
vcolin,
zoY,
zC,
zTarget,
weights = NULL,
catScaling = FALSE
```

Arguments

)

	not used, force arguments to be set by name
customCode	code name
coder	user supplied variable re-coder (see vignette for type signature)
codeSeq	argments to custom coder
V	variable name
vcolin	data column, numeric
zoY	outcome column as numeric
zC	if classification outcome column as character
zTarget	if classification target class
weights	per-row weights
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.

Value

wrapped custom coder

makekWayCrossValidationGroupedByColumn
Build a k-fold cross validation splitter, respecting (never splitting)
groupingColumn.

Description

Build a k-fold cross validation splitter, respecting (never splitting) groupingColumn.

Usage

makekWayCrossValidationGroupedByColumn(groupingColumnName)

26

Arguments

groupingColumnName

name of column to group by.

Value

splitting function in the sense of vtreat::buildEvalSets.

Examples

```
d <- data.frame(y=sin(1:100))
d$group <- floor(seq_len(nrow(d))/5)
splitter <- makekWayCrossValidationGroupedByColumn('group')
split <- splitter(nrow(d),5,d,d$y)
d$splitLabel <- vtreat::getSplitPlanAppLabels(nrow(d),split)
rowSums(table(d$group,d$splitLabel)>0)
```

mkCrossFrameCExperiment

Run categorical cross-frame experiment.

Description

Builds a designTreatmentsC treatment plan and a data frame prepared from dframe that is "cross" in the sense each row is treated using a treatment plan built from a subset of dframe disjoint from the given row. The goal is to try to and supply a method of breaking nested model bias other than splitting into calibration, training, test sets.

Usage

```
mkCrossFrameCExperiment(
  dframe,
  varlist,
  outcomename,
  outcometarget,
  . . . ,
  weights = c(),
  minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  codeRestriction = NULL,
  customCoders = NULL,
  scale = FALSE,
  doCollar = FALSE,
```

```
splitFunction = NULL,
ncross = 3,
forceSplit = FALSE,
catScaling = TRUE,
verbose = TRUE,
parallelCluster = NULL,
use_parallel = TRUE,
missingness_imputation = NULL,
imputation_map = NULL
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values.
outcometarget	Value/level of outcome to be considered "success", and there must be a cut such that dframe[[outcomename]]==outcometarget at least twice and dframe[[outcomename]]!=outcometarget at least twice.
	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan.
codeRestriction	n
	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	<pre>map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders. md).</pre>
scale	optional if TRUE replace numeric variables with regression ("move to outcome- scale").
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.
splitFunction	(optional) see vtreat::buildEvalSets .
ncross	optional scalar>=2 number of cross-validation rounds to design.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.

28

catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.
verbose	if TRUE print progress.
parallelCluster	
	(optional) a cluster object created by package parallel or package snow.
use_parallel	logical, if TRUE use parallel methods.
missingness_imputation	
	function of signature f(values: numeric, weights: numeric), simple missing value imputer.
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Value

named list containing: treatments, crossFrame, crossWeights, method, and evalSets

See Also

designTreatmentsC, designTreatmentsN, prepare.treatmentplan

```

mkCrossFrameMExperiment

Function to build multi-outcome vtreat cross frame and treatment plan.

Description

Please see vignette("MultiClassVtreat", package = "vtreat") https://winvector.github. io/vtreat/articles/MultiClassVtreat.html.

Usage

```
mkCrossFrameMExperiment(
  dframe,
  varlist,
  outcomename,
  . . . ,
 weights = c(),
 minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  codeRestriction = NULL,
  customCoders = NULL,
  scale = FALSE,
  doCollar = FALSE,
  splitFunction = vtreat::kWayCrossValidation,
  ncross = 3,
```

30

mkCrossFrameMExperiment

```
forceSplit = FALSE,
catScaling = FALSE,
y_dependent_treatments = c("catB"),
verbose = FALSE,
parallelCluster = NULL,
use_parallel = TRUE,
missingness_imputation = NULL,
imputation_map = NULL
)
```

Arguments

dframe	data to learn from
varlist	character, vector of indpendent variable column names.
outcomename	character, name of outcome column.
	not used, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.multinomial_plan.
codeRestriction	
	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	<pre>map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders. md).</pre>
scale	optional if TRUE replace numeric variables with regression ("move to outcome- scale").
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.
splitFunction	(optional) see vtreat::buildEvalSets .
ncross	optional scalar>=2 number of cross-validation rounds to design.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.
y_dependent_treatments	
	character what treatment types to build per-outcome level.
verbose	if TRUE print progress.

parallelCluster		
	(optional) a cluster object created by package parallel or package snow.	
use_parallel	logical, if TRUE use parallel methods.	
missingness_imputation		
	function of signature f(values: numeric, weights: numeric), simple missing value imputer.	
<pre>imputation_map</pre>	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.	

Value

a names list containing cross_frame, treat_m, score_frame, and fit_obj_id

See Also

prepare.multinomial_plan

# the prepare method.
dTestMTreated <- prepare(treatmentsM, dTestM, pruneSig=NULL)
dTestMTreated %.>%
    head(.) %.>%
    print(.)
```

mkCrossFrameNExperiment

Run a numeric cross frame experiment.

Description

Builds a designTreatmentsN treatment plan and a data frame prepared from dframe that is "cross" in the sense each row is treated using a treatment plan built from a subset of dframe disjoint from the given row. The goal is to try to and supply a method of breaking nested model bias other than splitting into calibration, training, test sets.

Usage

```
mkCrossFrameNExperiment(
  dframe.
  varlist,
 outcomename,
  . . . ,
 weights = c(),
 minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  codeRestriction = NULL,
  customCoders = NULL.
  scale = FALSE,
  doCollar = FALSE,
  splitFunction = NULL,
  ncross = 3,
  forceSplit = FALSE,
```

```
verbose = TRUE,
parallelCluster = NULL,
use_parallel = TRUE,
missingness_imputation = NULL,
imputation_map = NULL
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.	
varlist	Names of columns to treat (effective variables).	
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values and there must be a cut such that dframe[[outcomename]] is both above the cut at least twice and below the cut at least twice.	
	no additional arguments, declared to forced named binding of later arguments	
weights	optional training weights for each row	
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.	
smFactor	optional smoothing factor for impact coding models.	
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.	
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.	
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan.	
codeRestrictior		
	what types of variables to produce (character array of level codes, NULL means no restriction).	
customCoders	<pre>map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders. md).</pre>	
scale	optional if TRUE replace numeric variables with regression ("move to outcome- scale").	
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.	
splitFunction	(optional) see vtreat::buildEvalSets .	
ncross	optional scalar>=2 number of cross-validation rounds to design.	
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.	
verbose	if TRUE print progress.	
parallelCluster		
	(optional) a cluster object created by package parallel or package snow.	
use_parallel	logical, if TRUE use parallel methods.	

missingness_imputation	
	function of signature f(values: numeric, weights: numeric), simple missing value imputer.
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Value

named list containing: treatments, crossFrame, crossWeights, method, and evalSets

MultinomialOutcomeTreatment

Stateful object for designing and applying multinomial outcome treatments.

Description

Hold settings and results for multinomial classification data preparation.

Usage

```
MultinomialOutcomeTreatment(
    ...,
    var_list,
    outcome_name,
    cols_to_copy = NULL,
    params = NULL,
    imputation_map = NULL
)
```

Arguments

	not used, force arguments to be specified by name.
var_list	Names of columns to treat (effective variables).
outcome_name	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values.
cols_to_copy	list of extra columns to copy.
params	parameters list from multinomial_parameters
<pre>imputation_map</pre>	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

36
Details

Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_ transform_api.md, mkCrossFrameMExperiment and prepare.multinomial_plan for details.

Note: there currently is no designTreatmentsM, so MultinomialOutcomeTreatment\$fit() is implemented in terms of MultinomialOutcomeTreatment\$fit_transform()

multinomial_parameters

vtreat multinomial parameters.

Description

A list of settings and values for vtreat multinomial classification fitting. Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, mkCrossFrameMExperiment and prepare.multinomial_plan for details.

Usage

```
multinomial_parameters(user_params = NULL)
```

Arguments

user_params list of user overrides.

Value

filled out parameter list

novel_value_summary Report new/novel appearances of character values.

Description

Report new/novel appearances of character values.

Usage

```
novel_value_summary(dframe, trackedValues)
```

Arguments

dframe	Data frame to inspect.
trackedValues	optional named list mapping variables to know values, allows warnings upon
	novel level appearances (see track_values)

Value

frame of novel occurrences

See Also

prepare.treatmentplan,track_values

Examples

NumericOutcomeTreatment

Stateful object for designing and applying numeric outcome treatments.

Description

Hold settings and results for regression data preparation.

Usage

```
NumericOutcomeTreatment(
   ...,
   var_list,
   outcome_name,
   cols_to_copy = NULL,
   params = NULL,
   imputation_map = NULL
)
```

Arguments

	not used, force arguments to be specified by name.
var_list	Names of columns to treat (effective variables).
outcome_name	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values.
cols_to_copy	list of extra columns to copy.

oneWayHoldout

params	parameters list from regression_parameters	
imputation_map	map from column names to functions of signature f(values: numeric, weights:	
	numeric), simple missing value imputers.	

Details

Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_ transform_api.md, mkCrossFrameNExperiment, designTreatmentsN, and prepare.treatmentplan for details.

oneWayHoldout

One way holdout, a splitFunction in the sense of vtreat::buildEvalSets.

Description

Note one way holdout can leak target expected values, so it should not be preferred in nested modeling situations. Also, doesn't respect nSplits.

Usage

oneWayHoldout(nRows, nSplits, dframe, y)

Arguments

nRows	number of rows to split (integer >1).
nSplits	number of groups to split into (ignored).
dframe	original data frame (ignored).
У	numeric outcome variable (ignored).

Value

split plan

Examples

oneWayHoldout(3,NULL,NULL,NULL)

patch_columns_into_frame

Patch columns into data.frame.

Description

Add columns from new_frame into old_frame, replacing any columns with matching names in orig_frame with values from new_frame.

Usage

patch_columns_into_frame(orig_frame, new_frame)

Arguments

orig_frame	data.frame to patch into.
new_frame	data.frame to take replacement columns from.

Value

patched data.frame

Examples

orig_frame <- data.frame(x = 1, y = 2)
new_frame <- data.frame(y = 3, z = 4)
patch_columns_into_frame(orig_frame, new_frame)</pre>

```
prepare
```

Apply treatments and restrict to useful variables.

Description

Apply treatments and restrict to useful variables.

Usage

```
prepare(treatmentplan, dframe, ...)
```

Arguments

treatmentplan	Plan built by designTreantmentsC() or designTreatmentsN()
dframe	Data frame to be treated
	no additional arguments, declared to forced named binding of later arguments

See Also

prepare.treatmentplan, prepare.simple_plan, prepare.multinomial_plan

prepare.multinomial_plan

Function to apply mkCrossFrameMExperiment treatemnts.

Description

```
Please see vignette("MultiClassVtreat", package = "vtreat") https://winvector.github.
io/vtreat/articles/MultiClassVtreat.html.
```

Usage

```
## S3 method for class 'multinomial_plan'
prepare(
  treatmentplan,
  dframe,
  . . . ,
  pruneSig = NULL,
  scale = FALSE,
  doCollar = FALSE,
  varRestriction = NULL,
  codeRestriction = NULL,
  trackedValues = NULL,
  extracols = NULL,
  parallelCluster = NULL,
 use_parallel = TRUE,
  check_for_duplicate_frames = TRUE
)
```

Arguments

treatmentplan	multinomial_plan from mkCrossFrameMExperiment.
dframe	new data to process.
	not used, declared to forced named binding of later arguments
pruneSig	suppress variables with significance above this level
scale	optional if TRUE replace numeric variables with single variable model regres- sions ("move to outcome-scale"). These have mean zero and (for variables with significant less than 1) slope 1 when regressed (lm for regression problems/glm for classification problems) against outcome.
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.
varRestriction	optional list of treated variable names to restrict to

codeRestriction		
	optional list of treated variable codes to restrict to	
trackedValues	optional named list mapping variables to know values, allows warnings upon novel level appearances (see track_values)	
extracols	extra columns to copy.	
parallelCluster		
	(optional) a cluster object created by package parallel or package snow.	
use_parallel	logical, if TRUE use parallel methods.	
check_for_duplicate_frames		
	logical, if TRUE check if we called prepare on same data.frame as design step.	

Value

prepared data frame.

See Also

mkCrossFrameMExperiment, prepare

prepare.simple_plan Prepare a simple treatment.

Description

Prepare a simple treatment.

Usage

```
## S3 method for class 'simple_plan'
prepare(treatmentplan, dframe, ...)
```

Arguments

treatmentplan	A simple treatment plan.
dframe	data.frame to be treated.
	not used, present for S3 signature consistency.

See Also

design_missingness_treatment, prepare

prepare.treatmentplan

Examples

```
d <- wrapr::build_frame(
    "x1", "x2", "x3" |
    1 , 4 , "A" |
    NA , 5 , "B" |
    3 , 6 , NA )
plan <- design_missingness_treatment(d)
prepare(plan, d)
prepare(plan, data.frame(x1=NA, x2=NA, x3="E"))</pre>
```

prepare.treatmentplan Apply treatments and restrict to useful variables.

Description

Use a treatment plan to prepare a data frame for analysis. The resulting frame will have new effective variables that are numeric and free of NaN/NA. If the outcome column is present it will be copied over. The intent is that these frames are compatible with more machine learning techniques, and avoid a lot of corner cases (NA,NaN, novel levels, too many levels). Note: each column is processed independently of all others. Also copies over outcome if present. Note: treatmentplan's are not meant for long-term storage, a warning is issued if the version of vtreat that produced the plan differs from the version running prepare().

Usage

```
## S3 method for class 'treatmentplan'
prepare(
  treatmentplan,
  dframe,
  . . . ,
  pruneSig = NULL,
  scale = FALSE,
  doCollar = FALSE,
  varRestriction = NULL,
  codeRestriction = NULL,
  trackedValues = NULL,
  extracols = NULL,
  parallelCluster = NULL,
  use_parallel = TRUE,
  check_for_duplicate_frames = TRUE
)
```

Arguments

treatmentplan	Plan built by designTreantmentsC() or designTreatmentsN()	
dframe	Data frame to be treated	
	no additional arguments, declared to forced named binding of later arguments	
pruneSig	suppress variables with significance above this level	
scale	optional if TRUE replace numeric variables with single variable model regres- sions ("move to outcome-scale"). These have mean zero and (for variables with significant less than 1) slope 1 when regressed (lm for regression problems/glm for classification problems) against outcome.	
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.	
varRestriction	optional list of treated variable names to restrict to	
codeRestriction		
	optional list of treated variable codes to restrict to	
trackedValues	optional named list mapping variables to know values, allows warnings upon novel level appearances (see track_values)	
extracols	extra columns to copy.	
parallelCluster		
	(optional) a cluster object created by package parallel or package snow.	
use_parallel	logical, if TRUE use parallel methods.	
check_for_dupli	icate_frames	
	logical, if TRUE check if we called prepare on same data.frame as design step.	

Value

treated data frame (all columns numeric- without NA, NaN)

See Also

mkCrossFrameCExperiment, mkCrossFrameNExperiment, designTreatmentsC designTreatmentsN
designTreatmentsZ, prepare

Examples

```
# categorical example
set.seed(23525)
# we set up our raw training and application data
dTrainC <- data.frame(
    x = c('a', 'a', 'a', 'b', 'b', NA, NA),
    z = c(1, 2, 3, 4, NA, 6, NA),
    y = c(FALSE, FALSE, TRUE, FALSE, TRUE, TRUE, TRUE))
dTestC <- data.frame(
    x = c('a', 'b', 'c', NA),
    z = c(10, 20, 30, NA))</pre>
```

```
# we perform a vtreat cross frame experiment
# and unpack the results into treatmentsC
# and dTrainCTreated
unpack[
  treatmentsC = treatments,
  dTrainCTreated = crossFrame
  ] <- mkCrossFrameCExperiment(
   dframe = dTrainC,
   varlist = setdiff(colnames(dTrainC), 'y'),
    outcomename = 'y',
   outcometarget = TRUE,
    verbose = FALSE)
# the treatments include a score frame relating new
# derived variables to original columns
treatmentsC$scoreFrame[, c('origName', 'varName', 'code', 'rsq', 'sig', 'extraModelDegrees')] %.>%
  print(.)
# the treated frame is a "cross frame" which
# is a transform of the training data built
# as if the treatment were learned on a different
# disjoint training set to avoid nested model
# bias and over-fit.
dTrainCTreated %.>%
  head(.) %.>%
  print(.)
# Any future application data is prepared with
# the prepare method.
dTestCTreated <- prepare(treatmentsC, dTestC, pruneSig=NULL)</pre>
dTestCTreated %.>%
  head(.) %.>%
  print(.)
```

pre_comp_xval	Pre-computed cross-plan (so s	same split happens each time).

Description

Pre-computed cross-plan (so same split happens each time).

Usage

```
pre_comp_xval(nRows, nSplits, splitplan)
```

Arguments

nRows	number of rows to split (integer >1).
nSplits	number of groups to split into (ignored).
splitplan	split plan to actually use

Value

splitplan

Examples

```
p1 <- oneWayHoldout(3,NULL,NULL,NULL)
p2 <- pre_comp_xval(3, 3, p1)
p2(3, 3)</pre>
```

print.multinomial_plan

Print treatmentplan.

Description

Print treatmentplan.

Usage

```
## S3 method for class 'multinomial_plan'
print(x, ...)
```

Arguments

x	treatmentplan

... additional args (to match general signature).

46

print.simple_plan Print treatmentplan.

Description

Print treatmentplan.

Usage

S3 method for class 'simple_plan'
print(x, ...)

Arguments

х	treatmentplan
	additional args (to match general signature).

print.treatmentplan *Print treatmentplan*.

Description

Print treatmentplan.

Usage

S3 method for class 'treatmentplan'
print(x, ...)

Arguments

Х	treatmentplan
	additional args (to match general signature).

See Also

designTreatmentsC, designTreatmentsN, designTreatmentsZ, prepare.treatmentplan

print.vtreatment *Print treatmentplan*.

Description

Print treatmentplan.

Usage

S3 method for class 'vtreatment'
print(x, ...)

Arguments

Х	treatmentplan
	additional args (to match general signature).

See Also

designTreatmentsC, designTreatmentsN, designTreatmentsZ, prepare.treatmentplan

problemAppPlan check if appPlan is a good carve-up of 1:nRows into nSplits groups

Description

check if appPlan is a good carve-up of 1:nRows into nSplits groups

Usage

problemAppPlan(nRows, nSplits, appPlan, strictCheck)

Arguments

nRows	number of rows to carve-up
nSplits	number of sets to carve-up into
appPlan	carve-up to critique
strictCheck	logical, if true expect application data to be a carve-up and training data to be a maximal partition and to match nSplits.

Value

problem with carve-up (null if good)

regression_parameters

See Also

kWayCrossValidation, kWayStratifiedY, and makekWayCrossValidationGroupedByColumn

Examples

plan <- kWayStratifiedY(3,2,NULL,NULL)
problemAppPlan(3,3,plan,TRUE)</pre>

regression_parameters vtreat regression parameters.

Description

A list of settings and values for vtreat regression fitting. Please see https://github.com/WinVector/ vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, mkCrossFrameCExperiment, designTreatmentsC, and mkCrossFrameNExperiment, designTreatmentsN, prepare.treatmentplan for details.

Usage

regression_parameters(user_params = NULL)

Arguments

user_params list of user overrides.

Value

filled out parameter list

rquery_prepare

Materialize a treated data frame remotely.

Description

Materialize a treated data frame remotely.

Usage

```
rquery_prepare(
  db,
  rqplan,
  data_source,
  result_table_name,
  ...,
  extracols = NULL,
  temporary = FALSE,
 overwrite = TRUE,
 attempt_nan_inf_mapping = FALSE,
 col_sample = NULL,
 return_ops = FALSE
)
materialize_treated(
  db,
  rqplan,
 data_source,
  result_table_name,
  ...,
  extracols = NULL,
  temporary = FALSE,
 overwrite = TRUE,
  attempt_nan_inf_mapping = FALSE,
  col_sample = NULL,
  return_ops = FALSE
)
```

Arguments

db	a db handle.	
rqplan	an query plan produced by as_rquery_plan().	
data_source	relop, data source (usually a relop_table_source).	
result_table_na	ame	
	character, table name to land result in	
	force later arguments to bind by name.	
extracols	extra columns to copy.	
temporary	logical, if TRUE try to make result temporary.	
overwrite	logical, if TRUE try to overwrite result.	
attempt_nan_inf_mapping		
	logical, if TRUE attempt to map NaN and Infnity to NA/NULL (goot on Post- greSQL, not on Spark).	
col_sample	sample of data to determine column types.	
return_ops	logical, if TRUE return operator tree instead of materializing.	

50

solve_piecewise

Value

description of treated table.

Functions

• materialize_treated(): old name for rquery_prepare function

See Also

as_rquery_plan, rqdatatable_prepare

solve_piecewise

Solve as piecewise linear problem, numeric target.

Description

Return a vector of length y that is a piecewise function of x. This vector is picked as close to y (by square-distance) as possible for a set of x-only determined cut-points. Cross-validates for a good number of segments.

Usage

solve_piecewise(varName, x, y, w = NULL)

Arguments

varName	character, name of variable
х	numeric input (not empty, no NAs).
У	numeric or castable to such (same length as x no NAs), output to match
w	numeric positive, same length as x (weights, can be NULL)

Value

segmented y prediction

solve_piecewisec

Description

Return a vector of length y that is a piecewise function of x. This vector is picked as close to y (by square-distance) as possible for a set of x-only determined cut-points. Cross-validates for a good number of segments.

Usage

solve_piecewisec(varName, x, y, w = NULL)

Arguments

varName	character, name of variable
x	numeric input (not empty, no NAs).
У	numeric or castable to such (same length as x no NAs), output to match
W	numeric positive, same length as x (weights, can be NULL)

Value

segmented y prediction

spline_variable Spline variable numeric target.

Description

Return a spline approximation of data.

Usage

```
spline_variable(varName, x, y, w = NULL)
```

Arguments

varName	character, name of variable
х	numeric input (not empty, no NAs).
У	numeric or castable to such (same length as x no NAs), output to match
W	numeric positive, same length as x (weights, can be NULL)

Value

spline y prediction

spline_variablec Spline variable categorical target.

Description

Return a spline approximation of the change in log odds.

Usage

```
spline_variablec(varName, x, y, w = NULL)
```

Arguments

varName	character, name of variable
х	numeric input (not empty, no NAs).
У	numeric or castable to such (same length as x no NAs), output to match
W	numeric positive, same length as x (weights, can be NULL)

Value

spline y prediction

square_window Build a square windows va	riable, numeric target.
---	-------------------------

Description

Build a square moving average window (KNN in 1d). This is a high-frequency feature.

Usage

```
square_window(varName, x, y, w = NULL)
```

Arguments

varName	character, name of variable
x	numeric input (not empty, no NAs).
У	numeric or castable to such (same length as x no NAs), output to match
W	numeric positive, same length as x (weights, can be NULL) IGNORED

Value

segmented y prediction

Examples

d <- data.frame(x = c(NA, 1:6), y = c(0, 0, 0, 1, 1, 0, 0)) square_window("v", d\$x, d\$y)

square_windowc Build a square windows variable, categorical target.

Description

Build a square moving average window (KNN in 1d). This is a high-frequency feature. Approximation of the change in log odds.

Usage

square_windowc(varName, x, y, w = NULL)

Arguments

varName	character, name of variable
x	numeric input (not empty, no NAs).
У	numeric or castable to such (same length as x no NAs), output to match
W	numeric positive, same length as x (weights, can be NULL) IGNORED

Value

segmented y prediction

Examples

d <- data.frame(x = c(NA, 1:6), y = c(0, 0, 0, 1, 1, 0, 0))
square_window("v", d\$x, d\$y)</pre>

54

track_values

Description

Builds lists of observed unique character values of varlist variables from the data frame.

Usage

```
track_values(dframe, varlist)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).

Value

named list of values seen.

See Also

prepare.treatmentplan, novel_value_summary

Examples

```
set.seed(23525)
zip <- c(NA, paste('z', 1:100, sep = "_"))</pre>
N <- 500
d <- data.frame(zip = sample(zip, N, replace=TRUE),</pre>
                zip2 = sample(zip, N, replace=TRUE),
                y = runif(N)
dSample <- d[1:300, , drop = FALSE]
tplan <- designTreatmentsN(dSample,</pre>
                            c("zip", "zip2"), "y",
                            verbose = FALSE)
trackedValues <- track_values(dSample, c("zip", "zip2"))</pre>
# don't normally want to catch warnings,
# doing it here as this is an example
# and must not have unhandled warnings.
tryCatch(
  prepare(tplan, d, trackedValues = trackedValues),
  warning = function(w) { cat(paste(w, collapse = "\n")) })
```

UnsupervisedTreatment Stateful object for designing and applying unsupervised treatments.

Description

Hold settings and results for unsupervised data preparation.

Usage

```
UnsupervisedTreatment(
   ...,
   var_list,
   cols_to_copy = NULL,
   params = NULL,
   imputation_map = NULL
)
```

Arguments

	not used, force arguments to be specified by name.
var_list	Names of columns to treat (effective variables).
cols_to_copy	list of extra columns to copy.
params	parameters list from unsupervised_parameters
<pre>imputation_map</pre>	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Details

Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, designTreatmentsZ and prepare.treatmentplan for details.

Note: for UnsupervisedTreatment fit_transform(d) is implemented as fit(d) \$transform(d).

unsupervised_parameters

vtreat unsupervised parameters.

Description

A list of settings and values for vtreat unsupervised fitting. Please see https://github.com/ WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, designTreatmentsZ, and prepare.treatmentplan for details.

Usage

unsupervised_parameters(user_params = NULL)

value_variables_C

Arguments

user_params list of user overrides.

Value

filled out parameter list

value_variables_C Value variables for prediction a categorical outcome.

Description

Value variables for prediction a categorical outcome.

Usage

```
value_variables_C(
  dframe,
  varlist,
  outcomename,
  outcometarget,
  · · · ,
  weights = c(),
  minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  scale = FALSE,
  doCollar = FALSE,
  splitFunction = NULL,
  ncross = 3,
  forceSplit = FALSE,
  catScaling = TRUE,
  verbose = FALSE,
  parallelCluster = NULL,
  use_parallel = TRUE,
 customCoders = list(c.PiecewiseV.num = vtreat::solve_piecewisec, n.PiecewiseV.num =
  vtreat::solve_piecewise, c.knearest.num = vtreat::square_windowc, n.knearest.num =
    vtreat::square_window),
 codeRestriction = c("PiecewiseV", "knearest", "clean", "isBAD", "catB", "catP"),
 missingness_imputation = NULL,
  imputation_map = NULL
)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.	
varlist	Names of columns to treat (effective variables).	
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values.	
outcometarget	Value/level of outcome to be considered "success", and there must be a cut such that dframe[[outcomename]]==outcometarget at least twice and dframe[[outcomename]]!=outcometarget at least twice.	
	no additional arguments, declared to forced named binding of later arguments	
weights	optional training weights for each row	
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.	
smFactor	optional smoothing factor for impact coding models.	
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.	
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.	
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan.	
scale	optional if TRUE replace numeric variables with regression ("move to outcome- scale").	
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.	
splitFunction	(optional) see vtreat::buildEvalSets .	
ncross	optional scalar>=2 number of cross-validation rounds to design.	
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.	
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.	
verbose	if TRUE print progress.	
parallelCluster		
	(optional) a cluster object created by package parallel or package snow.	
use_parallel	logical, if TRUE use parallel methods.	
customCoders codeRestrictior		
codes to restrict to for variable importance estimate.		
missingness_imp	function of signature f(values: numeric, weights: numeric), simple missing value imputer.	
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.	

Value

table of variable valuations

value_variables_N Value variables for prediction a numeric outcome.

Description

Value variables for prediction a numeric outcome.

Usage

```
value_variables_N(
  dframe,
  varlist,
  outcomename,
  . . . ,
 weights = c(),
 minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  scale = FALSE,
  doCollar = FALSE,
  splitFunction = NULL,
  ncross = 3,
  forceSplit = FALSE,
  verbose = FALSE,
  parallelCluster = NULL,
  use_parallel = TRUE,
 customCoders = list(c.PiecewiseV.num = vtreat::solve_piecewisec, n.PiecewiseV.num =
  vtreat::solve_piecewise, c.knearest.num = vtreat::square_windowc, n.knearest.num =
    vtreat::square_window),
 codeRestriction = c("PiecewiseV", "knearest", "clean", "isBAD", "catB", "catP"),
 missingness_imputation = NULL,
  imputation_map = NULL
)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values and there must be a cut such that dframe[[outcomename]] is both above the cut at least twice and below the cut at least twice.
	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row

minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan.
scale	optional if TRUE replace numeric variables with regression ("move to outcome- scale").
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.
splitFunction	(optional) see vtreat::buildEvalSets .
ncross	optional scalar>=2 number of cross-validation rounds to design.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
verbose	if TRUE print progress.
parallelCluster	r de la companya de la
	(optional) a cluster object created by package parallel or package snow.
use_parallel	logical, if TRUE use parallel methods.
customCoders	additional coders to use for variable importance estimate.
codeRestriction	1
	codes to restrict to for variable importance estimate.
missingness_imp	
	function of signature f(values: numeric, weights: numeric), simple missing value imputer.
<pre>imputation_map</pre>	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Value

table of variable valuations
