Package 'AFR'

January 20, 2025

Type Package

Title Toolkit for Regression Analysis of Kazakhstan Banking Sector Data

Version 0.3.6

Copyright The Agency of the Republic of Kazakhstan for Regulation and Development of Financial Market (ARDFM)

Author Timur Abilkassymov [aut],
Shyngys Shuneyev [aut],
Alua Makhmetova [aut],
Sultan Zhaparov [aut, cre]

Maintainer Sultan Zhaparov <saldau.sultan@gmail.com>

Description
Tool is created for regression, prediction and forecast analysis of macroeconomic and credit data. The package includes functions from existing R packages adapted for banking sector of Kazakhstan.
The purpose of the package is to optimize statistical functions for easier interpretation for bank analysts and non-statisticians.

License GPL-2

Depends R (>= 3.5.0)

Imports car, forecast, zoo, regclass, olsrr, stats, lmtest, graphics,nlme, ggplot2, tseries, gridExtra, utils, rlang, xts, writexl, mFilter,nortest, goftest, cli

Suggests knitr, rmarkdown, roxygen2

SystemRequirements C++

bg *Breusch-Godfrey test [BG test]*

Description

BG test is used to test for autocorrelation in the errors of a regression model

Usage

```
bg(
  model,
  order = 1,
  order.by = NULL,
  type = c("Chisq", "F"),
  data = list(),
  fill = 0
)
```

Arguments

`model`	is a (generalized)linear regression model
`order`	integer. maximal order of serial correlation to be tested.
`order.by`	Either a vector z or a formula with a single explanatory variable like ~ z
`type`	the type of test statistic to be returned
`data`	an optional data frame containing the variables in the model
`fill`	starting values for the lagged residuals in the auxiliary regression. By default 0 but can also be set to NA.

References

Mitchel, D. and Zeileis, A. Published 2021-11-07. lmtest package

Examples

```
model <- lm(real_gdp ~ imp + exp + poil + eurkzt + tonia_rate, data = macroKZ)
bg(model)
```

---

bp *Breusch-Pagan test*

Description

Breusch-Pagan test is used to test against heteroskedasticity of a time-series

Usage

```
bp(model, varformula = NULL, studentize = TRUE, data = list())
```

Arguments

`model`	is a (generalized)linear regression model
`varformula`	a formula describing only the potential explanatory variables for the variance (no dependent variable needed). By default the same explanatory variables are taken as in the main regression model.
`studentize`	logical. If set to TRUE Koenker's studentized version of the test statistic will be used.
`data`	an optional data frame containing the variables in the model

References

Torsten, H., Zeileis, A., Farebrother, Richard W., Cummins, C., Millo, G., Mitchell, D., lmtest package Wang, B., 2014, bstats package

Examples

```
model <- lm(real_gdp ~ imp + exp + poil + eurkzt + tonia_rate, data = macroKZ)
bp(model)
```

checkdata *Preliminary data check for errors*

Description

Preliminary check of data frame for missing values, numeric format, outliers.

Missing items: The number of missing values in each column of the dataset. Numeric format: The number of non-numeric variables in each column of the dataset. Outliers: The number of outliers in each column of the dataset.

Usage

```
checkdata(x)
```

Arguments

x	is a data frame

Examples

```
data(macroKZ)
checkdata(macroKZ)
```

check_betas *All possible regression variable coefficients.*

Description

Returns the coefficients for each variable from each model.

Usage

```
check_betas(object, ...)
```

Arguments

object	An object of class `lm`.
...	Other arguments.

Value

`check_betas` returns a `data.frame` containing:

x	model

References

Hebbali, Aravind. Published 2020-02-10. olsrr package

Examples

```
model <- lm(real_gdp~imp+exp+usdkzt+eurkzt, data = macroKZ)
check_betas(model)
```

`corsel` *Multicollinearity test*

Description

multicollinearity is the occurence of high interrelations among two or more independent variables in a multiple regression.

Usage

```
corsel(x, thrs, num)
```

Arguments

`x`	is a numeric vector or matrix
`thrs`	threshold set to calculate correlation above
`num`	logical

Examples

```
data(macroKZ)
corsel(macroKZ,num=FALSE,thrs=0.65)
```

`dec_plot` *Decomposition plot*

Description

The function depicts decomposition of regressors as a stacked barplot

Usage

```
dec_plot(model, dataset, print_plot = TRUE)
```

Arguments

model	An object of class lm.
dataset	A dataset based on which model was built
print_plot	logical

Author(s)

The Agency of the Republic of Kazakhstan for Regulation and Development of Financial Market (AFR)

References

Hebbali, Aravind. Published 2020-02-10. olssr package

Examples

```
data(macroKZ)
model <- lm(real_gdp ~ usdkzt + eurkzt + imp+exp, data = macroKZ)
dec_plot(model, macroKZ)
```

---

difflog *Transforming time-series data to stationary*

Description

Difference of logarithms is finding the difference between two consecutive logarithm values of a time-series

Usage

```
difflog(x, lag = 1, difference = 1)
```

Arguments

x	time-series vector
lag	lagged period
difference	difference between x items

Examples

```
data (macroKZ)
new<-pct1(macroKZ)
```

finratKZ *finratKZ dataset*

Description

finratKZ dataset

Usage

```
finratKZ
```

Format

Dataset of 400 corporate borrowers, i.e. 200 standard (IFRS stage 1) and 200 default ones, characterized by 29 financial ratios.

Default Dummy variable where 0 - standard(IFRS stage 1) borrower, 1 - default borrower

Rev_gr Revenue growth rate

EBITDA_gr EBITDA growth rate

Cap_gr Capital growth rate

CR Current ratio

QR Quick ratio

Cash_ratio Cash ratio

WC_cycle Working capital cycle

DTA Debt-to-assets

DTE Debt-to-equity

LR Leverage ratio (Total assets/Total equity)

EBITDA_debt EBITDA-to-debt

IC Interest coverage (Income statement)

CTI Cash-to-income

IC_CF Interest coverage (Cash flow statement)

DCR Debt coverage ratio (Cash flow from operations/Total debt)

CFR Cash flow to revenue

CRA Cash return on assets (Cash flow from operations/Total assets)

CRE Cash return on equity (Cash flow from operations/Total equity)

ROA Return on assets

ROE Return on equity

NPM Net profit margin

GPM Gross profit margin

OPM Operating profit margin

RecT Receivables turnover

InvT Inventory turnover

PayT Payables turnover

TA Total assets turnover

FA Fixed assets turnover

WC Working capital turnover

`gq` *Godfrey-Quandt test*

Description

Godfrey-Quandt test is used to test against heteroskedasticity of a time-series

Usage

```
gq(
  model,
  point = 0.5,
  fraction = 0,
  alternative = c("greater", "two.sided", "less"),
  order.by = NULL,
  data = list()
)
```

Arguments

`model`	is a (generalized)linear regression model
`point`	numerical. If point is smaller than 1 it is interpreted as percentages of data
`fraction`	numerical. The number of central observations to be omitted.
`alternative`	a character string specifying the alternative hypothesis.
`order.by`	Either a vector z or a formula with a single explanatory variable like ~ z
`data`	an optional data frame containing the variables in the model.

References

Torsten, H., Zeileis, A., Farebrother, Richard W., Cummins, C., Millo, G., Mitchell, D., lmtest package Wang, B., 2014, bstats package

Examples

```
model <- lm(real_gdp ~ imp + exp + poil + eurkzt + tonia_rate, data = macroKZ)
gq(model)
```

HP *Hodrick-Prescott filter for time series data*

Description

Hodrick-Prescott filter is a data smoothing technique that removes trending in time series data frame

Usage

```
HP(x, freq = NULL, type = c("lambda", "frequency"), drift = FALSE)
```

Arguments

x	time-series vector
freq	integer
type	character, indicating the filter type
drift	logical

Examples

```
data(macroKZ)
HP(macroKZ[,2])
```

macroKZ *macroKZ dataset*

Description

macroKZ dataset

Usage

```
macroKZ
```

Format

A time series data frame of 57 quarterly observations of 50 macroeconomic and 10 financial parameters for 2010-2024 period.

ols_test_normality *Test for normality Test for detecting violation of normality assumption.*

Description

Test for normality Test for detecting violation of normality assumption.

Usage

```
ols_test_normality(model, ...)
```

Arguments

model	an object of class lm.
...	Other arguments.

Value

ols_test_normality is a list containing the following components:

kolmogorv	kolmogorov smirnov statistic
shapiro	shapiro wilk statistic
cramer	cramer von mises statistic
anderson	anderson darling statistic

Examples

```
data(macroKZ)
model <- lm(real_gdp ~ imp + exp + usdkzt + poil, data = macroKZ)
ols_test_normality(model)
```

opt_size *Necessary size of the time-series dataset*

Description

Estimates number of models generated from given number of regressors X

Usage

```
opt_size(model)
```

Arguments

model	is a linear regression model a class lm.

Examples

```
data(macroKZ)
model <- lm(real_gdp ~ imp + exp + poil + eurkzt + tonia_rate, data = macroKZ)
opt_size(model)
```

---

pct1 *Transforming time-series data to stationary*

Description

Percent change is a change between two consecutive terms,

Usage

```
pct1(x)
```

Arguments

x	time-series vector(s)

Examples

```
data (macroKZ)
new<-pct1(macroKZ)
```

---

pct4 *Transforming time-series data to stationary*

Description

Percent change is a change between a term and its lagged value for prior period,

Usage

```
pct4(x)
```

Arguments

x	time-series vector(s)

Examples

```
data (macroKZ)
new<-pct4(macroKZ)
```

pt_multi *Pluto-Tasche method for multi-year probability of default (PD) analysis*

Description

Calculates the variation inflation factors of all predictors in regression models

Usage

```
pt_multi(pf, num_def, conf_level, num_years)
```

Arguments

pf	unconditional portfolio distribution from the worst to the best credit quality
num_def	number of defaults in a given rating class
conf_level	confidence interval of PD estimates
num_years	number of periods used in the PD estimation

Examples

```
pf <- c(10,20,30,40)
num_def <- c(1,2,3,4)
conf_level = 0.99
num_years = 3
pt_multi(pf, num_def, conf_level, num_years)
```

pt_one *Pluto-Tasche method for one-year probability of default (PD) analysis*

Description

Calculates probability of default according to One-period Pluto and Tasche model

Usage

```
pt_one(pf, num_def, ci = 0.9)
```

Arguments

pf	unconditional portfolio distribution from the worst to the best credit quality
num_def	number of defaults in a given rating class
ci	condifence interval of PD estimates

References

Surzhko, Denis. Published 2015-05-21. LDPD package. Archived on 2022-06-20.

Examples

```
pf <- c(10,20,30,40)
num_def <- c(1,2,3,4)
pt_one(pf, num_def, ci= 0.9)
```

`regsel_f` *Regressors selection*

Description

The function allows to choose regressors based on multiple criteria as AIC, RMSE etc

Usage

```
regsel_f(
  model,
  pval = 0.3,
  metric = "adjr" & "aic",
  progress = FALSE,
  details = FALSE,
  ...
)
```

Arguments

`model`	is a linear regression model
`pval`	p value; variables with p value less than `pval` will enter into the model
`metric`	statistical metrics used to estimate the best model
`progress`	Logical; if TRUE, will display variable selection progress.
`details`	Logical; if `TRUE`, will print the regression result at each step.
`...`	other arguments

References

Hebbali, Aravind. Published 2020-02-10. olssr package

Examples

```
data(macroKZ)
model <- lm(real_gdp ~ imp + exp + poil + eurkzt + tonia_rate, data = macroKZ)
regsel_f(model)
```

reg_plot *Regression forecast plot*

Description

The function depicts forecast and actual data.

Usage

```
reg_plot(model, dataset)
```

Arguments

model	An object of class lm.
dataset	A dataset based on which model was built.

Author(s)

The Agency of the Republic of Kazakhstan for Regulation and Development of Financial Market (AFR)

Examples

```
data(macroKZ)
model <- lm(real_gdp ~ usdkzt + eurkzt + imp + exp, data = macroKZ)
reg_plot(model, macroKZ)
```

reg_test *Test for detecting violation of Gauss-Markov assumptions.*

Description

Test for detecting violation of Gauss-Markov assumptions.

Usage

```
reg_test(y)
```

Arguments

y	A numeric vector or an object of class lm.

Value

reg_test returns an object of class "reg_test". An object of class "reg_test" is a list containing the following components:

bp	Breusch-Pagan statistic
bg	Breusch-Godfrey statistic
dw	Durbin-Watson statistic
gq	Godfrey-Quandt statistic

Examples

```
data(macroKZ)
model <- lm(real_gdp~ imp + exp + poil + eurkzt + usdkzt, macroKZ)
reg_test(model)
```

---

vif_reg *VIF by variable*

Description

Calculates the variation inflation factors of all predictors in regression models

Usage

```
vif_reg(model)
```

Arguments

model	is a linear regression model

References

Petrie, Adam. Published 2020-02-21. regclass package

Examples

```
data(macroKZ)
model <- lm(real_gdp ~ imp + exp + poil + eurkzt + tonia_rate, data = macroKZ)
vif_reg(model)
```
