

Package ‘BHMSMAfMRI’

January 20, 2025

Type Package

Title Bayesian Hierarchical Multi-Subject Multiscale Analysis of Functional MRI (fMRI) Data

Version 2.2

Date 2024-06-12

Description Package BHMSMAfMRI performs Bayesian hierarchical multi-subject multiscale analysis of fMRI data as described in Sanyal & Ferreira (2012) <[DOI:10.1016/j.neuroimage.2012.08.041](https://doi.org/10.1016/j.neuroimage.2012.08.041)>, or other multiscale data, using wavelet-based prior that borrows strength across subjects and provides posterior smoothed images of the effect sizes and samples from the posterior distribution.

BHMSMAfMRI-package	<i>Bayesian Hierarchical Multi-Subject Multiscale Analysis (BHMSMA) of Functional MRI Data</i>
--------------------	--

Description

The **BHMSMAfMRI** package performs BHMSMA (Sanyal & Ferreira, 2012) of fMRI data, or other multiscale data, using wavelet based prior that borrows strength across subjects and provides posterior smoothed images of the effect sizes and samples from the posterior distribution. The package currently considers analysis of 2D slices/grids only.

Details

Package: BHMSMAfMRI
 Type: Package
 Version: 2.2
 Date: 2022-10-01
 License: GPL (>= 2)

Import fMRI data using:

[readfmridata](#)

The main analysis function, which provides subject-specific posterior estimates, is:

[BHMSMA](#)

The main function successively calls the following functions:

[glmcoef](#) (get regression coefficients)

[waveletcoef](#) (get wavelet coefficients)

[hyperparamest](#) (estimate model hyperparameters)

[postmixprob](#) (estimate posterior mixture probabilities of wavelet coefficients)

[postwaveletcoef](#) (compute posterior estimates of wavelet coefficients)

[postglmcoef](#) (compute posterior estimates of regression coefficients)

For posterior group estimates of regression coefficients use:

[postgroupglmcoef](#)

For posterior uncertainty estimates use:

`postsamples`

Internal sample data:

`fmridata`

Miscellaneous:

`substituteWaveletCoef`

BHMSMA

Bayesian hierarchical multi-subject multiscale analysis (BHMSMA) of functional MRI data or other multiscale data

Description

BHMSMA is the main function that performs BHMSMA (Sanyal & Ferreira, 2012) of fMRI data, or other multiscale data, using wavelet-based prior that borrows strength across subjects and provides posterior smooth estimates of the effect sizes. Specifically, BHMSMA constructs a 2D regression coefficient map (e.g., corresponding to a single brain slice) of a given regressor and returns its posterior smoothed version based on multi-subject or single subject analyses.

Usage

```
BHMSMA(n, grid, data, designmat, k, analysis="multi",
        truecoef=NULL, wave.family="DaubLeAsymm", filter.number=6,
        bc="periodic")
```

Arguments

<code>n</code>	Number of subjects.
<code>grid</code>	The number of voxels in one row (or column) of the brain slice of interest. Must be a power of 2. The total number of voxels is grid^2 . The maximum value of <code>grid</code> for this package is 512.
<code>data</code>	The data in the form of an array with dimension $(n, \text{grid}, \text{grid}, \text{ntime})$, where <code>ntime</code> is the size of the time series for each voxel. The rows (first dimension) must correspond to <code>n</code> .

<code>designmat</code>	The design matrix used to generate the data. The rows must correspond to n . It should include an intercept column if desired. No intercept column will be added by the function. The GLM fit will include all the columns of <code>designmat</code> .
<code>k</code>	Index of the regressor chosen for analysis, consistently with <code>designmat</code> . After fitting GLM, the regression coefficients of this regressor will be considered for the rest of the analysis.
<code>analysis</code>	"MSA" or "SSA", depending on whether performing multi-subject analysis or single subject analysis.
<code>truecoef</code>	If available, the true GLM coefficients in the form of an array with dimension $(n, \text{grid}, \text{grid})$. NULL by default.
<code>wave.family</code>	The family of wavelets to use - "DaubExPhase" or "DaubLeAsymm". Default is "DaubLeAsymm".
<code>filter.number</code>	The number of vanishing moments of the wavelet. Default is 6.
<code>bc</code>	The boundary condition to use - "periodic" or "symmetric". Default is "periodic".

Details

The wavelet computations are performed by using the R package **wavethresh**.

Value

A list containing the following.

<code>GLMCoefStandardized</code>	An array of dimension $(n, \text{grid}, \text{grid})$, containing for each subject the standardized GLM coefficients obtained by fitting GLM to the time-series corresponding to the voxels.
<code>GLMCoefSE</code>	An array of dimension $(n, \text{grid}, \text{grid})$, containing for each subject the estimated standard errors of the GLM coefficients.
<code>WaveletCoefficientMatrix</code>	A matrix of dimension (n, grid^2-1) , containing for each subject the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
<code>hyperparam</code>	A vector containing the estimates of the six hyperparameters.
<code>hyperparamVar</code>	Estimated covariance matrix of the hyperparameters.
<code>posteriorMixProb</code>	A matrix of dimension (n, grid^2-1) , containing the <code>piklj.bar</code> values (see Reference for details).
<code>PostMeanWaveletCoef</code>	A matrix of size (n, grid^2-1) , containing for each subject the posterior mean of the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
<code>GLMcoefposterior</code>	An array of dimension $(n, \text{grid}, \text{grid})$, containing for each subject the posterior means of the standardized GLM coefficients.
<code>MSE</code>	MSE of the posterior estimates of the GLM coefficients, if the true values of the GLM coefficients are available.

analysis <- "multi"
system.time({BHMSMAmulti <- BHMSMA(n,grid,data,
  designmat,k,analysis)})

## End(Not run)
```

fmridata

A simulated fMRI data for 3 subjects

Description

A simulated fMRI data containing true regression coefficients images for three subjects and design matrix

Usage

```
data(fmridata)
```

Format

A list containing the following.

grid =32. The image dimension is 32 by 32.

nsubject =3.

TrueCoeff An array of dimension (3,32,32), containing the true regression coefficients for the 3 subjects.

DesignMatrix A matrix with 9 columns and 2 rows. The first column is a column of ones.

Details

This dataset contains only the true coefficients. The noisy fMRI data, which are generated by adding Gaussian random noise to these true coefficients, are included in the `extdata` directory within the package directory. The function `readfmridata` can be used to read those data files. The true coefficients and the noisy data both are generated using the R package `neuRosim`. The following specifications were used to generate the data: `totaltime=18`, `onsets=seq(1,18,by=8)`, `durations=1`, `TR=2`, `effectsize=1`, `hrf="double-gamma"`, `regions=3`, `radius=c(1,1,1)`, `form="sphere"`, `fading=1`, `SNR=1.5`, `noise="white"`. The centers of the activation regions were chosen manually. For information regarding the specifications, see `neuRosim` help.

glmcoef	<i>Fit GLM (general linear model) to the fMRI time-series of all voxels within a single 2D brain slice</i>
---------	--

Description

glmcoef fits a GLM to the fMRI time-series of all voxels within a single 2D brain slice for each subject, and returns standardized GLM coefficients along with their standard error for the included regressors (it does not add any intercept by itself).

Usage

```
glmcoef(n, grid, data, designmat)
```

Arguments

n	Number of subjects.
grid	The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is grid^2 . The maximum value of grid for this package is 512.
data	The data in the form of an array with dimension $(n, \text{grid}, \text{grid}, \text{ntime})$, where ntime is the size of the time series for each voxel.
designmat	The design matrix used to generate the data. An intercept column should be included unless not desired.

Value

A list containing the following.

GLMCoefStandardized

An array of dimension $(n, \text{grid}, \text{grid})$, containing for each subject the standardized GLM coefficients obtained by fitting GLM to the time-series corresponding to the voxels.

GLMCoefSE

An array of dimension $(n, \text{grid}, \text{grid})$, containing for each subject the estimated standard errors of the GLM coefficients.

n <- 3
grid <- 8
ntime <- 10
designmat <- cbind(rep(1,10),c(rep(c(1,0),5)))
data <- array(dim=c(n,grid,grid,ntime),
  rnorm(n*grid*grid*ntime))
glm.fit <- glmcoef(n,grid,data,designmat)
dim(glm.fit$GLMCoefStandardized)
#[1] 3 8 8
```

hyperparamest

Obtain estimates of the hyperparameters of the BHMSMA model

Description

hyperparamest computes the MLEs (maximum likelihood estimates) of the hyperparameters of the BHMSMA model using an empirical Bayes approach for multi-subject or single subject analyses, and returns the hyperparameters estimates along with their covariance matrix estimate (see References).

Usage

```
hyperparamest(n, grid, waveletcoefmat, analysis)
```

Arguments

n	Number of subjects.
grid	The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is $grid^2$. The maximum value of grid for this package is 512.
waveletcoefmat	A matrix of dimension $(n, grid^2-1)$, containing for each subject the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
analysis	"multi" or "single", depending on whether performing multi-subject analysis or single subject analysis.

Value

A list containing the following.

hyperparam	A vector containing the estimates of the six hyperparameters of the BHMSMA model.
hyperparamVar	Estimated covariance matrix of the hyperparameters.

```
set.seed(1)
n <- 3
grid <- 8
waveletcoefmat <- array(dim=c(n,grid^2-1),
  rnorm(n*(grid^2-1)))
analysis <- "multi"
hyperest <- hyperparamest(n,grid,waveletcoefmat,analysis)
hyperest$hyperparam
# [1] 1.00000 1.00000 1.00000 1.00000 0.00000 28.37678
```

postglmcoef

Obtain posterior estimate of a 2D GLM coefficients map of a regressor

Description

postglmcoef computes posterior mean (or median) of a 2D GLM coefficients map (e.g., corresponding to a single brain slice) of a regressor using the posterior mean (or median) of the corresponding wavelet coefficients in the inverse discrete wavelet transform for each subject based on multi-subject or single subject analyses (see References).

Usage

```
postglmcoef(n, grid, glmcoefstd, postmeanwaveletcoef,
  wave.family="DaubLeAsymm", filter.number=6, bc="periodic")
```

Arguments

n Number of subjects.

grid The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is grid^2 . The maximum value of **grid** for this package is 512.

<code>glmcoefstd</code>	An array of dimension $(n, \text{grid}, \text{grid})$, containing for each subject the standardized GLM coefficients obtained by fitting GLM to the time-series corresponding to the voxels.
<code>postmeanwaveletcoef</code>	A matrix of size (n, grid^2-1) , containing for each subject the posterior mean of the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
<code>wave.family</code>	The family of wavelets to use - "DaubExPhase" or "DaubLeAsymm". Default is "DaubLeAsymm".
<code>filter.number</code>	The number of vanishing moments of the wavelet. Default is 6.
<code>bc</code>	The boundary condition to use - "periodic" or "symmetric". Default is "periodic".

Details

The wavelet transformation and reconstruction are performed by using the functions `imwd` and `imwr`, respectively.

Value

A list containing the following.

<code>GLMcoefposterior</code>	An array of dimension $(n, \text{grid}, \text{grid})$, containing for each subject the posterior means of the standardized GLM coefficients.

  dim=c(n,(grid^2-1)))
postmeanglmcoef <- postglmcoef(n,grid,glmcoefstd,
  postmeanwaveletcoef)
dim(postmeanglmcoef$GLMcoefposterior)
#[1] 3 8 8
```

postgroupglmcoef	<i>Obtain posterior group estimate of a 2D GLM coefficients map of a regressor</i>
------------------	--

Description

postgroupglmcoef computes posterior group mean (or group median) of a 2D GLM coefficients map (e.g., corresponding to a single brain slice) of a regressor using the posterior means (or medians) of the corresponding wavelet coefficients from all subjects in the inverse discrete wavelet transform based on multi-subject or single subject analyses (see References).

Usage

```
postgroupglmcoef( n, grid, glmcoefstd, postmeanwaveletcoef,
  wave.family="DaubLeAsymm", filter.number=6, bc="periodic" )
```

Arguments

n	Number of subjects.
grid	The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is $grid^2$. The maximum value of grid for this package is 512.
glmcoefstd	An array of dimension (n,grid,grid), containing for each subject the standardized GLM coefficients obtained by fitting GLM to the time-series corresponding to the voxels.
postmeanwaveletcoef	A matrix of size (n, $grid^2-1$), containing for each subject the posterior mean of the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
wave.family	The family of wavelets to use - "DaubExPhase" or "DaubLeAsymm". Default is "DaubLeAsymm".
filter.number	The number of vanishing moments of the wavelet. Default is 6.
bc	The boundary condition to use - "periodic" or "symmetric". Default is "periodic".

Details

The wavelet transformation and reconstruction are performed by using the functions `imwd` and `imwr`, respectively.

Value

A list containing the following.

groupcoef	A matrix of dimension (grid, grid), containing the posterior group coefficients obtained by BHMSMA methodology.

```

postmixprob

Obtain estimates of the mixture probabilities defining the BHMSMA posterior wavelet coefficients distributions

Description

postmixprob computes the mixture probabilities (piklj.bar), which define the marginal posterior distribution of the wavelet coefficients of the BHMSMA model, using Newton Cotes algorithm for each subject based on multi-subject or single subject analyses, and returns the same (see References).

Usage

```
postmixprob(n, grid, waveletcoefmat, hyperparam, analysis)
```

Arguments

n	Number of subjects.
grid	The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is grid^2 . The maximum value of grid for this package is 512.
waveletcoefmat	A matrix of dimension (n, grid^2-1) , containing for each subject the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
hyperparam	A vector containing the estimates of the six hyperparameters.
analysis	"MSA" or "SSA", depending on whether performing multi-subject analysis or single subject analysis.

Value

A list containing the following.

pkljbar A matrix of dimension (n, grid^2-1) , containing the piklj bar values.

```
set.seed(1)
n <- 3
grid <- 8
waveletcoefmat <- matrix(nrow=n,ncol=grid^2-1)
for(i in 1:n) waveletcoefmat[i,] <- rnorm(grid^2-1)
hyperparam <- rep(.1,6)
analysis <- "multi"
pkljbar <- postmixprob(n,grid,waveletcoefmat,hyperparam,
  analysis)
dim(pkljbar$pkljbar)
#[1] 3 63
```

postsamples	<i>Obtain samples from the posterior distribution of a 2D GLM coefficient map.</i>
-------------	--

Description

postsamples generates samples from the posterior distribution of a 2D GLM coefficient map (e.g., corresponding to a single brain slice) of a regressor in the BHMSMA model for each subject based on multi-subject or single subject analyses (see References).

Usage

```
postsamples(nsample, n, grid, glmcoefstd, waveletcoefmat,
hyperparam, pkljbar, analysis, wave.family="DaubLeAsymm",
filter.number=6, bc="periodic", seed)
```

Arguments

nsample	Number of samples to be generated.
n	Number of subjects.
grid	The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is $grid^2$. The maximum value of grid for this package is 512.
glmcoefstd	An array of dimension $(n, grid, grid)$, containing for each subject the standardized GLM coefficients obtained by fitting GLM to the time-series corresponding to the voxels.
waveletcoefmat	A matrix of dimension $(n, grid^2-1)$, containing for each subject the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
hyperparam	A vector containing the estimates of the six hyperparameters.
pkljbar	A matrix of dimension $(n, grid^2-1)$, containing the piklj bar values (see References for details).
analysis	"MSA" or "SSA", depending on whether performing multi-subject analysis or single subject analysis.
wave.family	The family of wavelets to use - "DaubExPhase" or "DaubLeAsymm". Default is "DaubLeAsymm".
filter.number	The number of vanishing moments of the wavelet. Default is 6.
bc	The boundary condition to use - "periodic" or "symmetric". Default is "periodic".
seed	Must be a positive integer. Provide to set random number generation seed for reproducibility.

Details

The wavelet computations are performed by using the R package **wavethresh**.

Value

A list containing the following.

- | | |
|---------------|---|
| samples | An array of dimension (n,grid,grid,nsample), containing for each subject the posterior samples of the GLM coefficients. |
| postdiscovery | An array of dimension (n,grid,grid), containing for each subject the posterior discovery maps of the GLM coefficients (for details see Morris et al. (2011)). |

postwaveletcoef *Obtain posterior estimates of the BHMSMA wavelet coefficients*

Description

postwaveletcoef computes posterior mean and posterior median of the wavelet coefficients of the BHMSMA model for each subject based on multi-subject or single subject analyses (see References).

Usage

```
postwaveletcoef(n, grid, waveletcoefmat, hyperparam,
pkljbar, analysis)
```

Arguments

n	Number of subjects.
grid	The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is $grid^2$. The maximum value of grid for this package is 512.
waveletcoefmat	A matrix of dimension $(n, grid^2-1)$, containing for each subject the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
hyperparam	A vector containing the estimates of the six hyperparameters.
pkljbar	A matrix of dimension $(n, grid^2-1)$, containing the piklj bar values.
analysis	"MSA" or "SSA", depending on whether performing multi-subject analysis or single subject analysis.

Value

A list containing the following.

PostMeanWaveletCoef

A matrix of size $(n, grid^2-1)$, containing for each subject the posterior mean of the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).

PostMedianWaveletCoef

A matrix of size $(n, grid^2-1)$, containing for each subject the posterior median of the wavelet coefficients of all levels stacked together.

readfmridata

Import fMRI data from various fMRI image files

Description

readfmridata reads and imports fMRI data from various fMRI image files (Analyze, NIFTI and AFNI) into a 4D array. It is just a convenient wrapper around the data importing functions provided by the **oro.nifti** package.

Usage

```
readfmridata( directory, format, prefix, nimages, dim.image,
  nii=TRUE )
```

Arguments

directory	Location of the directory where the fMRI image files are stored. Insert within quotations ("").
format	The format of the data file. One of "Analyze" (.img/.hdr files), "Nifti" (.img/.hdr files or .nii files) or "Afn" (.HEAD/.BRIK files).

prefix	If format is "Analyze" or "Nifti", then the part of the fMRI image file name appearing before the image number. The image number is assumed to have four digit representation, that is, the lowest number is 0001 and the highest possible number is 9999. If format is "Afni", then the file name. Insert within quotations("").
nimages	If format is "Analyze", number of images to be read beginning from the first image. If format is "Afni", not necessary.
dim.image	Size of the 3D fMRI image. A vector with three elements.
nii	Necessary only for "Nifti" format. nii=TRUE (default) indicates the image files are in .nii files . nii=FALSE indicates the image files are .img/.hdr files.

Details

The function uses package **oro.nifti** for reading from fMRI data files.

Value

A list containing the following:

fmridata	An array of dimension (dim.image, nimages), containing the image data for all images/time-points.
----------	---

# import simulated fMRI data from image files provided within this package
fpath <- system.file("extdata", package="BHMSMAfMRI")
untar(paste0(fpath,"/fmridata.tar"), exdir=tempdir())
data <- array(dim=c(3,32,32,9))
for(subject in 1:3)
{
  directory <- paste0(tempdir(),"/fmridata","/s0",subject,"/")
  a <- readfmridata(directory, format="Analyze", prefix=paste0("s0",subject,"_t"),
    nimages=9, dim.image=c(32,32,1))
  data[subject,,] <- a[,1,]
}
dim(a)
```

substituteWaveletCoef *Substitute 2D wavelet transform coefficients with user-given values*

Description

substituteWaveletCoef substitutes the wavelet coefficients stored wavelet object generated through 2D wavelet transform with user-given values and returns the modified wavelet object.

Usage

```
substituteWaveletCoef(grid, waveletobj, values)
```

Arguments

grid	The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is grid^2 . The maximum value of grid for this package is 512.
waveletobj	A wavelet object of class <code>imwd.object</code> , usually obtained by performing 2D wavelet transformion through the function <code>imwd</code> of package wavethresh .
values	The values with which the wavelet coefficients are to be replaced. The order should be consistent with <code>imwd.object</code> class.

Details

The maximum value of `grid` for this package is 512.

Value

A wavelet object of class `imwd.object` with updated wavelet coefficients.

grid <- 8
ntime <- 10
designmat <- cbind( rep(1,10), c(rep(c(1,0),5)) )
data <- array(dim=c(n,grid,grid,ntime),
             rnorm(n*grid*grid*ntime))
```

```

glm.fit <- glmcoef(n, grid, data, designmat)
glmcoefstd <- glm.fit$GLMCoefStandardized[, , 1]
dwt = wavethresh::imwd(glmcoefstd[1, , ], type="wavelet",
  family="DaubLeAsymm", filter.number=6, bc="periodic")
dwt

values = rnorm(grid^2-1)
dwtnew = substituteWaveletCoef(grid, dwt, values)
dwtnew

```

waveletcoef	<i>Apply discrete wavelet transform (DWT) to a 2D GLM coefficient map of a regressor</i>
-------------	--

Description

waveletcoef applies DWT to a 2D GLM coefficient map (e.g., corresponding to a single brain slice) of a regressor for each subject, and returns the wavelet coefficients at all resolution levels. This function wraps around the wavelet transformation function `imwd` of the **wavethresh** package.

Usage

```

waveletcoef(n, grid, glmcoefstd, wave.family="DaubLeAsymm",
  filter.number=6, bc="periodic")

```

Arguments

n	Number of subjects.
grid	The number of voxels in one row (or, one column) of the brain slice of interest. Must be a power of 2. The total number of voxels is grid^2 . The maximum value of grid for this package is 512.
glmcoefstd	An array of dimension (n,grid,grid), containing for each subject the standardized GLM coefficients of a regressor obtained by fitting GLM to the time-series corresponding to the voxels.
wave.family	The family of wavelets to use - "DaubExPhase" or "DaubLeAsymm". Default is "DaubLeAsymm".
filter.number	The number of vanishing moments of the wavelet. Default is 6.
bc	The boundary condition to use - "periodic" or "symmetric". Default is "periodic".

Details

The wavelet decomposition is performed by using the function `imwd`.

Value

A list containing the following.

WaveletCoefficientMatrix

A matrix of dimension $(n, \text{grid}^2 - 1)$, containing for each subject the wavelet coefficients of all levels stacked together (by the increasing order of resolution level).
