

Package ‘ggpedigree’

July 4, 2025

Title Visualizing Pedigrees with ‘ggplot2’ and ‘plotly’

Version 0.8.0

Date/Publication 2025-07-04 19:30:05 UTC

Description Provides plotting functions for visualizing pedigrees in behavior genetics and kinship research. The package complements ‘BGmisc’ [Garrison et al. (2024) <[doi:10.21105/joss.06203](https://doi.org/10.21105/joss.06203)>] by rendering pedigrees using the ‘ggplot2’ framework and offers a modern alternative to the base-graphics pedigree plot in ‘kinship2’ [Sinnwell et al. (2014) <[doi:10.1159/000363105](https://doi.org/10.1159/000363105)>]. Features include support for duplicated individuals, complex mating structures, integration with simulated pedigrees, and layout customization.

ASOIAF

A pedigree of ice and fire

Description

A structured dataset of fictional characters derived from the Song of Ice and Fire universe by George R. R. Martin. The character relationships were partially based on a GEDCOM file publicly posted in the [Westeros.org forum](<https://asoiaf.westeros.org/index.php?topic/88863-all-the-family-trees/>), and were updated based on publicly available summaries from [A Wiki of Ice and Fire](https://awoiaf.westeros.org/index.php/Main_Page). This dataset was created for educational and illustrative purposes, such as demonstrating pedigree construction, relationship tracing, and algorithmic logic in family-based data. It includes no narrative content or protected expression from the original works. No rights to the characters, names, or intellectual property of George R. R. Martin or HBO are claimed, and the dataset is not intended to represent any real individuals or families.

Usage

```
data(ASOIAF)
```

Format

A data frame with 679 observations

Details

The variables are as follows:

- **id**: Person identification variable
- **momID**: ID of the mother
- **dadID**: ID of the father
- **name**: Name of the person
- **sex**: Biological sex
- **twinID**: ID of the twin, if applicable
- **zygosity**: Zygosity of the twin, if applicable. mz is monozygotic; dz is dizygotic

buildPlotConfig *build Config*

Description

This function builds a configuration list for ggPedigree plots. It merges a default configuration with user-specified settings, ensuring all necessary parameters are set.

Usage

```
buildPlotConfig(default_config, config, function_name = "ggPedigree")
```

Arguments

- default_config** A list of default configuration parameters.
config A list of user-specified configuration parameters.
function_name The name of the function for which the configuration is being built.

Value

A complete configuration list with all necessary parameters.

`calculateConnections` *Calculate connections for a pedigree dataset*

Description

Computes graphical connection paths for a pedigree layout, including parent-child, sibling, and spousal connections. Optionally processes duplicate appearances of individuals (marked as ‘extra’) to ensure relational accuracy.

Usage

```
calculateConnections(
  ped,
  config = list(),
  spouseID = "spouseID",
  personID = "personID",
  momID = "momID",
  famID = "famID",
  twinID = "twinID",
  dadID = "dadID"
)
```

Arguments

<code>ped</code>	A data frame containing the pedigree data. Needs <code>personID</code> , <code>momID</code> , and <code>dadID</code> columns
<code>config</code>	List of configuration parameters. Currently unused but passed through to internal helpers.
<code>spouseID</code>	Character string specifying the column name for spouse IDs. Defaults to "spouseID".
<code>personID</code>	Character string specifying the column name for individual IDs. Defaults to "personID".
<code>momID</code>	Character string specifying the column name for mother IDs. Defaults to "momID".
<code>famID</code>	Character string specifying the column name for family IDs. Defaults to "famID".
<code>twinID</code>	Character string specifying the column name for twin IDs. Defaults to "twinID".
<code>dadID</code>	Character string specifying the column name for father IDs. Defaults to "dadID".

Value

A ‘data.frame‘ containing connection points and midpoints for graphical rendering. Includes:

- ‘x_pos’, ‘y_pos’: positions of focal individual
- ‘x_dad’, ‘y_dad’, ‘x_mom’, ‘y_mom’: parental positions (if available)

- ‘x_spouse’, ‘y_spouse’: spousal positions (if available)
- ‘x_midparent’, ‘y_midparent’: midpoint between parents
- ‘x_mid_sib’, ‘y_mid_sib’: sibling group midpoint
- ‘x_mid_spouse’, ‘y_mid_spouse’: midpoint between spouses

`calculateCoordinates` *Calculate coordinates for plotting individuals in a pedigree*

Description

Extracts and modifies the x and y positions for each individual in a pedigree data frame using the align.pedigree function from the ‘kinship2’ package. It returns a data.frame with positions for plotting.

Usage

```
calculateCoordinates(
  ped,
  personID = "personID",
  momID = "momID",
  dadID = "dadID",
  spouseID = "spouseID",
  sexVar = "sex",
  twinID = "twinID",
  code_male = NULL,
  config = list()
)
```

Arguments

<code>ped</code>	A data frame containing the pedigree data. Needs personID, momID, and dadID columns
<code>personID</code>	Character string specifying the column name for individual IDs. Defaults to "personID".
<code>momID</code>	Character string specifying the column name for mother IDs. Defaults to "momID".
<code>dadID</code>	Character string specifying the column name for father IDs. Defaults to "dadID".
<code>spouseID</code>	Character. Name of the column in ‘ped’ for the spouse ID variable.
<code>sexVar</code>	Character. Name of the column in ‘ped’ for the sex variable.
<code>twinID</code>	Character string specifying the column name for twin IDs. Defaults to "twinID".
<code>code_male</code>	Value used to indicate male sex. Defaults to NULL.
<code>config</code>	List of configuration options:

- code_male** Default is 1. Used by BGmisc::recodeSex().
ped_packed Logical, default TRUE. Passed to ‘kinship2::align.pedigree‘.
ped_align Logical, default TRUE. Align generations.
ped_width Numeric, default 15. Controls spacing.

Value

A data frame with one or more rows per person, each containing:

- ‘x_order‘, ‘y_order‘: Grid indices representing layout rows and columns.
- ‘x_pos‘, ‘y_pos‘: Continuous coordinate positions used for plotting.
- ‘nid‘: Internal numeric identifier for layout mapping.
- ‘extra‘: Logical flag indicating whether this row is a secondary appearance.

computeDistance

Compute distance between two points

Description

This function calculates the distance between two points in a 2D space using Minkowski distance. It can be used to compute Euclidean or Manhattan distance. It is a utility function for calculating distances in pedigree layouts. Defaults to Euclidean distance if no method is specified.

Usage

```
computeDistance(method = "euclidean", x1, y1, x2, y2, p = NULL)
```

Arguments

method	Character. Method of distance calculation. Options are "euclidean", "cityblock", and "Minkowski".
x1	Numeric. X-coordinate of the first point.
y1	Numeric. Y-coordinate of the first point.
x2	Numeric. X-coordinate of the second point.
y2	Numeric. Y-coordinate of the second point.
p	Numeric. The order of the Minkowski distance. If NULL, defaults to 2 for Euclidean and 1 for Manhattan. If Minkowski method is used, p should be specified.

countOffspring	<i>Count offspring of each individual</i>
----------------	---

Description

Count offspring of each individual

Usage

```
countOffspring(ped, personID = "ID", momID = "momID", dadID = "dadID")
```

Arguments

ped	A data frame containing the pedigree information
personID	character. Name of the column in ped for the person ID variable
momID	character. Name of the column in ped for the mother ID variable
dadID	character. Name of the column in ped for the father ID variable

Value

A data frame with an additional column, offspring, that contains the number of offspring for each individual

Examples

```
library(BGmisc)
data("potter")
countOffspring(potter,
  personID = "personID",
  momID = "momID", dadID = "dadID"
)
```

countSiblings	<i>Count siblings of each individual</i>
---------------	--

Description

Count siblings of each individual

Usage

```
countSiblings(ped, personID = "ID", momID = "momID", dadID = "dadID")
```

Arguments

ped	A data frame containing the pedigree information
personID	character. Name of the column in ped for the person ID variable
momID	character. Name of the column in ped for the mother ID variable
dadID	character. Name of the column in ped for the father ID variable

Value

A data frame with an additional column, *siblings*, that contains the number of siblings for each individual

Examples

```
library(BGmisc)
data("potter")
countSiblings(potter, personID = "personID")
```

generateSpouseList *Generate a spouselist matrix*

Description

Generate a spouselist matrix

Usage

```
generateSpouseList(
  ped,
  personID = "personID",
  momID = "momID",
  dadID = "dadID",
  spouseID = "spouseID"
)
```

Arguments

ped	A data frame containing the pedigree information
personID	Character. Name of the column in ped for the person ID variable
momID	Character. Name of the column in ped for the mother ID variable
dadID	Character. Name of the column in ped for the father ID variable
spouseID	Character. Name of the column in ped for the spouse ID variable

Value

A spouselist matrix

Examples

```
library(BGmisc)
data("potter")
generateSpouseList(potter,
  personID = "personID",
  momID = "momID", dadID = "dadID", spouseID = "spouseID"
)
```

`getDefaultPlotConfig` *Shared Default Plotting Configuration*

Description

Centralized configuration list used by all gg-based plotting functions. Returns a named list of default settings used by all gg-based plotting functions. This configuration can be overridden by supplying a list of key-value pairs to plotting functions such as ‘`ggPedigree()`‘, ‘`ggRelatednessMatrix()`‘, and ‘`ggPhenotypeByDegree()`‘. Each key corresponds to a configurable plot, layout, or aesthetic behavior.

Usage

```
getDefaultPlotConfig(
  function_name = "getDefaultPlotConfig",
  personID = "personID",
  status_column = NULL,
  alpha_default = 1,
  apply_default_scales = TRUE,
  apply_default_theme = TRUE,

)

```

Arguments

<code>function_name</code>	The name of the function calling this configuration.
<code>personID</code>	The column name for person identifiers in the data.
<code>status_column</code>	The column name for affected status in the data.
<code>alpha_default</code>	Default alpha transparency level.
<code>apply_default_scales</code>	Whether to apply default color scales.

```
apply_default_theme  
    Whether to apply default ggplot2 theme.  
segment_default_color  
    A character string for the default color of segments in the plot.  
color_palette_default  
    A character vector of default colors for the plot.  
color_palette_low  
    Color for the low end of a gradient.  
color_palette_mid  
    Color for the midpoint of a gradient.  
color_palette_high  
    Color for the high end of a gradient.  
color_scale_midpoint  
    Midpoint value for continuous color scales.  
color_scale_theme  
    Name of the color scale used (e.g., "ggthemes::calc").  
alpha  
    Default alpha transparency for plot elements.  
plot_title  
    Main title of the plot.  
plot_subtitle  
    Subtitle of the plot.  
value_rounding_digits  
    Number of digits to round displayed values.  
code_male  
    Integer code for males in data.  
filter_n_pairs  
    Threshold to filter maximum number of pairs.  
filter_degree_min  
    Minimum degree value used in filtering.  
filter_degree_max  
    Maximum degree value used in filtering.  
drop_classic_kin  
    Whether to exclude classic kin categories.  
drop_non_classic_sibs  
    Whether to exclude non-classic sibs.  
use_only_classic_kin  
    Whether to restrict analysis to classic kinship.  
use_relative_degree  
    Whether to use relative degrees instead of absolute.  
group_by_kin  
    Whether to group output by kinship group.  
match_threshold_percent  
    Kinbin matching threshold as a percentage.  
max_degree_levels  
    Maximum number of degree levels to show.  
grouping_column  
    Name of column used for grouping.  
annotate_include  
    Whether to include annotations.
```

```

annotate_x_shift
    Horizontal shift applied to annotation text.
annotate_y_shift
    Vertical shift applied to annotation text.
label_include
    Whether to display labels on plot points.
label_column
    Column to use for text labels.
label_method
    Method used for labeling (e.g., ggrepel, geom_text).
label_max_overlaps
    Maximum number of overlapping labels.
label_nudge_x
    Horizontal nudge for label text.
label_nudge_y
    Vertical nudge for label text.
label_segment_color
    Segment color for label connectors.
label_text_angle
    Text angle for labels.
label_text_size
    Font size for labels.
label_text_color
    Color of the label text.
label_text_family
    Font family for label text.
point_size
    Size of points drawn in plot.
outline_include
    Whether to include outlines around points.
outline_multiplier
    Multiplier to compute outline size from point size.
outline_additional_size
    Additional size added to outlines.
outline_alpha
    Alpha transparency for point outlines.
outline_color
    Color used for point outlines.
tooltip_include
    Whether tooltips are shown in interactive plots.
tooltip_columns
    Columns to include in tooltips.
axis_x_label
    Label for the X-axis.
axis_y_label
    Label for the Y-axis.
axis_text_angle_x
    Angle of X-axis text.
axis_text_angle_y
    Angle of Y-axis text.
axis_text_size
    Font size of axis text.
axis_text_color
    Color of axis text.

```

```
axis_text_family
    Font family for axis text.
generation_height
    Vertical spacing of generations.
generation_width
    Horizontal spacing of generations.
ped_packed
    Whether the pedigree should use packed layout.
ped_align
    Whether to align pedigree generations.
ped_width
    Plot width of the pedigree block.
segment_linewidth
    Line width for segments.
segment_linetype
    Line type for segments.
segment_lineend
    Line end type for segments.
segment_linejoin
    Line join type for segments.
segment_offspring_color
    Color for offspring segments.
segment_parent_color
    Color for parent segments.
segment_self_color
    Color for self-loop segments.
segment_sibling_color
    Color for sibling segments.
segment_spouse_color
    Color for spouse segments.
segment_mz_color
    Color for monozygotic twin segments.
segment_mz_linetype
    Line type for MZ segments.
segment_mz_alpha
    Alpha for MZ segments.
segment_mz_t
    Tuning parameter for MZ segment layout.
segment_self_linetype
    Line type for self-loop segments.
segment_self_linewidth
    Width of self-loop segment lines.
segment_self_alpha
    Alpha value for self-loop segments.
segment_self_angle
    Angle of self-loop segment.
segment_self_curvature
    Curvature of self-loop segment.
```

```

sex_color_include
    Whether to color nodes by sex.
sex_legend_title
    Title of the sex legend.
sex_shape_labels
    Labels used in sex legend.
sex_color_palette
    A character vector of colors for sex.
sex_shape_female
    Shape for female nodes.
sex_shape_male  Shape for male nodes.
sex_shape_unknown
    Shape for unknown sex nodes.
status_include  Whether to display affected status.
status_code_affected
    Value that encodes affected status.
status_code_unaffected
    Value that encodes unaffected status.
status_label_affected
    Label for affected status.
status_label_unaffected
    Label for unaffected status.
status_alpha_affected
    Alpha for affected individuals.
status_alpha_unaffected
    Alpha for unaffected individuals. Default is 0 (transparent).
status_color_palette
    A character vector of colors for affected status.
status_color_affected
    Color for affected individuals.
status_color_unaffected
    Color for unaffected individuals.
status_shape_affected
    Shape for affected individuals.
status_legend_title
    Title of the status legend.
status_legend_show
    Whether to show the status legend.
overlay_shape  Shape used for overlaying points in the plot. Default is 4 (cross).
overlay_code_affected
    Code for affected individuals in overlay. Default is 1.
overlay_code_unaffected
    Code for unaffected individuals in overlay. Default is 0.
overlay_label_affected
    Label for affected individuals in overlay. Default is "Affected".

```

```
overlay_label_unaffected
    Label for unaffected individuals in overlay. Default is "Unaffected".
overlay_alpha_affected
    Alpha for affected individuals in overlay. Default is 1.
overlay_alpha_unaffected
    Alpha for unaffected individuals in overlay. Default is 0.
overlay_color  Color for overlay points. Default is "black".
overlay_include
    Whether to include overlay points in the plot. Default is FALSE.
overlay_legend_title
    Title of the overlay legend. Default is "Overlay".
overlay_legend_show
    Whether to show the overlay legend. Default is FALSE.
focal_fill_include
    Whether to fill focal individuals.
focal_fill_legend_show
    Whether to show legend for focal fill.
focal_fill_personID
    ID of focal individual.
focal_fill_legend_title
    Title of focal fill legend.
focal_fill_high_color
    High-end color for focal gradient.
focal_fill_mid_color
    Midpoint color for focal gradient.
focal_fill_low_color
    Low-end color for focal gradient.
focal_fill_scale_midpoint
    Midpoint for focal fill scale.
focal_fill_method
    Method used for focal fill gradient.
focal_fill_component
    Component type for focal fill.
focal_fill_n_breaks
    Number of breaks in focal fill scale.
focal_fill_na_value
    Color for NA values in focal fill.
focal_fill_shape
    Shape used for focal fill points.
focal_fill_force_zero
    Whether to force zero to NA in focal fill.
focal_fill_hue_range
    Hue range for focal fill colors.
focal_fill_chroma
    Chroma value for focal fill colors.
```

```

focal_fill_lightness
    Lightness value for focal fill colors.
focal_fill_hue_direction
    Direction of focal fill gradient.
focal_fill_viridis_option
    Option for viridis color scale.
focal_fill_viridis_begin
    Start of viridis color scale.
focal_fill_viridis_end
    End of viridis color scale.
focal_fill_viridis_direction
    Direction of viridis color scale (1 for left to right, -1 for right to left).
focal_fill_color_values
    A character vector of colors for focal fill.
focal_fill_labels
    Labels for focal fill colors.
ci_include      Whether to show confidence intervals.
ci_ribbon_alpha
    Alpha level for CI ribbons.
tile_color_palette
    Color palette for matrix plots.
tile_interpolate
    Whether to interpolate colors in matrix tiles.
tile_color_border
    Color border for matrix tiles.
tile_cluster     Whether to sort by clusters the matrix.
tile_geom        Geometry type for matrix tiles (e.g., "geom_tile", "geom_raster").
tile_na_rm       Whether to remove NA values in matrix tiles.
tile_linejoin   Line join type for matrix tiles.
matrix_diagonal_include
    Whether to include diagonal in matrix plots.
matrix_upper_triangle_include
    Whether to include upper triangle in matrix plots.
matrix_lower_triangle_include
    Whether to include lower triangle in matrix plots.
matrix_sparse    Whether matrix input is sparse.
matrix_isChild_method
    Method used for isChild matrix derivation.
return_static   Whether to return a static plot.
return_widget   Whether to return a widget object.
return_interactive
    Whether to return an interactive plot.
return_midparent
    Whether to return midparent values in the plot.

```

```
debug      Whether to enable debugging mode.  
override_many2many  
          Whether to override many-to-many link logic.  
...  
          Additional arguments for future extensibility.
```

Value

A named list of default plotting and layout parameters.

ggPedigree	<i>Plot a custom pedigree diagram</i>
------------	---------------------------------------

Description

Generates a ggplot2-based diagram of a pedigree using custom coordinate layout, calculated relationship connections, and flexible styling via ‘config’. It processes the data using ‘ped2fam()’. This function supports multiple families and optionally displays affected status and sex-based color/shape.

Usage

```
ggPedigree(  
  ped,  
  famID = "famID",  
  personID = "personID",  
  momID = "momID",  
  dadID = "dadID",  
  spouseID = "spouseID",  
  matID = "matID",  
  patID = "patID",  
  twinID = "twinID",  
  status_column = NULL,  
  focal_fill_column = NULL,  
  tooltip_columns = NULL,  
  overlay_column = NULL,  
  return_widget = FALSE,  
  config = list(),  
  debug = FALSE,  
  hints = NULL,  
  interactive = FALSE,  
  phantoms = FALSE,  
  ...  
)  
  
ggpedigree(  
  ped,  
  famID = "famID",  
  personID = "personID",
```

```

momID = "momID",
dadID = "dadID",
spouseID = "spouseID",
matID = "matID",
patID = "patID",
twinID = "twinID",
status_column = NULL,
focal_fill_column = NULL,
tooltip_columns = NULL,
overlay_column = NULL,
return_widget = FALSE,
config = list(),
debug = FALSE,
hints = NULL,
interactive = FALSE,
phantoms = FALSE,
...
)

```

Arguments

<code>ped</code>	A data frame containing the pedigree data. Needs personID, momID, and dadID columns
<code>famID</code>	Character string specifying the column name for family IDs. Defaults to "famID".
<code>personID</code>	Character string specifying the column name for individual IDs. Defaults to "personID".
<code>momID</code>	Character string specifying the column name for mother IDs. Defaults to "momID".
<code>dadID</code>	Character string specifying the column name for father IDs. Defaults to "dadID".
<code>spouseID</code>	Character string specifying the column name for spouse IDs. Defaults to "spouseID".
<code>matID</code>	Character string specifying the column name for maternal lines Defaults to "matID".
<code>patID</code>	Character string specifying the column name for paternal lines Defaults to "patID".
<code>twinID</code>	Character string specifying the column name for twin IDs. Defaults to "twinID".
<code>status_column</code>	Character string specifying the column name for affected status. Defaults to NULL.
<code>focal_fill_column</code>	Character string specifying the column name for focal fill color.
<code>tooltip_columns</code>	Character vector of column names to show when hovering. Defaults to c("personID", "sex"). Additional columns present in 'ped' can be supplied – they will be added to the Plotly tooltip text. Defaults to NULL, which uses the default tooltip columns.
<code>overlay_column</code>	Character string specifying the column name for overlay alpha values.

return_widget	Logical; if TRUE (default) returns a plotly htmlwidget. If FALSE, returns the underlying plotly object (useful for further customization before printing).
config	A list of configuration options for customizing the plot. See getDefaultPlotConfig for details. The list can include:
code_male	Integer or string. Value identifying males in the sex column. (typically 0 or 1) Default: 1.
segment_spouse_color, segment_self_color	Character. Line colors for respective connection types.
segment_sibling_color, segment_parent_color, segment_offspring_color	Character. Line colors for respective connection types.
label_text_size, point_size, segment_linewidth	Numeric. Controls text size, point size, and line thickness.
generation_height	Numeric. Vertical spacing multiplier between generations. Default: 1.
shape_unknown, shape_female, shape_male, status_shape_affected	Integers. Shape codes for plotting each group.
sex_shape_labels	Character vector of labels for the sex variable. (default: c("Female", "Male", "Unknown"))
unaffected, affected	Values indicating unaffected/affected status.
sex_color_include	Logical. If TRUE, uses color to differentiate sex.
label_max_overlaps	Maximum number of overlaps allowed in repelled labels.
label_segment_color	Color used for label connector lines.
debug	Logical. If TRUE, prints debugging information. Default: FALSE.
hints	Data frame with hints for layout adjustments. Default: NULL.
interactive	Logical. If TRUE, generates an interactive plot using ‘plotly’. Default: FALSE.
phantoms	Logical. If TRUE, adds phantom parents for individuals without parents.
...	Additional arguments passed to ‘ggplot2’ functions.

Value

A ‘ggplot’ object rendering the pedigree diagram.

Examples

```
library(BGmisc)
data("potter")
ggPedigree(potter, famID = "famID", personID = "personID")

data("hazard")
ggPedigree(hazard, famID = "famID", personID = "ID", config = list(code_male = 0))
```

`ggPedigreeInteractive` *Interactive pedigree plot (Plotly wrapper around ggPedigree)*

Description

Generates an interactive HTML widget built on top of the static `ggPedigree` output. All layout, styling, and connection logic are inherited from `ggPedigree()`; this function simply augments the plot with Plotly hover, zoom, and pan functionality.

Usage

```
ggPedigreeInteractive(
  ped,
  famID = "famID",
  personID = "personID",
  momID = "momID",
  dadID = "dadID",
  patID = "patID",
  matID = "matID",
  twinID = "twinID",
  status_column = NULL,
  tooltip_columns = NULL,
  focal_fill_column = NULL,
  overlay_column = NULL,
  config = list(),
  debug = FALSE,
  return_widget = TRUE,
  phantoms = FALSE,
  ...
)

ggpedigreeinteractive(
  ped,
  famID = "famID",
  personID = "personID",
  momID = "momID",
  dadID = "dadID",
  patID = "patID",
  matID = "matID",
  twinID = "twinID",
  status_column = NULL,
  tooltip_columns = NULL,
  focal_fill_column = NULL,
  overlay_column = NULL,
  config = list(),
  debug = FALSE,
  return_widget = TRUE,
```

```

phantoms = FALSE,
...
)

ggpedigreeInteractive(
  ped,
  famID = "famID",
  personID = "personID",
  momID = "momID",
  dadID = "dadID",
  patID = "patID",
  matID = "matID",
  twinID = "twinID",
  status_column = NULL,
  tooltip_columns = NULL,
  focal_fill_column = NULL,
  overlay_column = NULL,
  config = list(),
  debug = FALSE,
  return_widget = TRUE,
  phantoms = FALSE,
  ...
)

```

Arguments

ped	A data frame containing the pedigree data. Needs personID, momID, and dadID columns
famID	Character string specifying the column name for family IDs. Defaults to "famID".
personID	Character string specifying the column name for individual IDs. Defaults to "personID".
momID	Character string specifying the column name for mother IDs. Defaults to "momID".
dadID	Character string specifying the column name for father IDs. Defaults to "dadID".
patID	Character string specifying the column name for paternal lines Defaults to "patID".
matID	Character string specifying the column name for maternal lines Defaults to "matID".
twinID	Character string specifying the column name for twin IDs. Defaults to "twinID".
status_column	Character string specifying the column name for affected status. Defaults to NULL.
tooltip_columns	Character vector of column names to show when hovering. Defaults to c("personID", "sex"). Additional columns present in 'ped' can be supplied – they will be added to the Plotly tooltip text. Defaults to NULL, which uses the default tooltip columns.

focal_fill_column Character string specifying the column name for focal fill color.

overlay_column Character string specifying the column name for overlay alpha values.

config A list of configuration options for customizing the plot. See `getDefaultPlotConfig` for details. The list can include:

- code_male** Integer or string. Value identifying males in the sex column. (typically 0 or 1) Default: 1.
- segment_spouse_color, segment_self_color** Character. Line colors for respective connection types.
- segment_sibling_color, segment_parent_color, segment_offspring_color** Character. Line colors for respective connection types.
- label_text_size, point_size, segment_linewidth** Numeric. Controls text size, point size, and line thickness.
- generation_height** Numeric. Vertical spacing multiplier between generations. Default: 1.
- shape_unknown, shape_female, shape_male, status_shape_affected** Integers. Shape codes for plotting each group.
- sex_shape_labels** Character vector of labels for the sex variable. (default: c("Female", "Male", "Unknown"))
- unaffected, affected** Values indicating unaffected/affected status.
- sex_color_include** Logical. If TRUE, uses color to differentiate sex.
- label_max_overlaps** Maximum number of overlaps allowed in repelled labels.
- label_segment_color** Color used for label connector lines.

debug Logical. If TRUE, prints debugging information. Default: FALSE.

return_widget Logical; if TRUE (default) returns a plotly htmlwidget. If FALSE, returns the underlying plotly object (useful for further customization before printing).

phantoms Logical. If TRUE, adds phantom parents for individuals without parents.

... Additional arguments passed to ‘`ggplot2`’ functions.

Value

A plotly htmlwidget (or plotly object if ‘`return_widget = FALSE`’).

Examples

```
library(BGmisc)
data("potter")
ggPedigreeInteractive(potter, famID = "famID", personID = "personID")
```

ggPhenotypeByDegree *Plot correlation of genetic relatedness by phenotype*

Description

This function plots the phenotypic correlation as a function of genetic relatedness.

Usage

```
ggPhenotypeByDegree(
  df,
  y_var,
  y_se = NULL,
  y_stem_se = NULL,
  y_ci_lb = NULL,
  y_ci_ub = NULL,
  config = list(),
  data_prep = TRUE,
  ...
)
```

Arguments

df	Data frame containing pairwise summary statistics. Required columns: addRel_min Minimum relatedness per group addRel_max Maximum relatedness per group n_pairs Number of pairs at that relatedness cnu Indicator for shared nuclear environment (1 = yes, 0 = no) mtdna Indicator for shared mitochondrial DNA (1 = yes, 0 = no)
y_var	Name of the y-axis variable column (e.g., "r_pheno_rho").
y_se	Name of the standard error column (e.g., "r_pheno_se").
y_stem_se	Optional; base stem used to construct SE ribbon bounds. (e.g., "r_pheno")
y_ci_lb	Optional; lower bound for confidence interval (e.g., "r_pheno_ci_lb").
y_ci_ub	Optional; upper bound for confidence interval (e.g., "r_pheno_ci_ub").
config	A list of configuration overrides. Valid entries include: filter_n_pairs Minimum number of pairs to include (default: 500) filter_degree_min Minimum degree of relatedness (default: 0) filter_degree_max Maximum degree of relatedness (default: 7) plot_title Plot title plot_subtitle Plot subtitle color_scale Paletteer color scale name (e.g., "ggthemes::calc") use_only_classic_kin If TRUE, only classic kin are shown group_by_kin If TRUE, use classic kin × mtDNA for grouping

drop_classic_kin If TRUE, remove classic kin rows
drop_non_classic_sibs If TRUE, remove non-classic sibs (default: TRUE)
annotate_include If TRUE, annotate mother/father/sibling points
annotate_x_shift Relative x-axis shift for annotations
annotate_y_shift Relative y-axis shift for annotations
point_size Size of geom_point points (default: 1)
use_relative_degree If TRUE, x-axis uses degree-of-relatedness scaling
grouping_column Grouping column name (default: mtDNA_factor)
value_rounding_digits Number of decimal places for rounding (default: 2)
match_threshold_percent Tolerance % for matching known degrees
max_degree_levels Maximum number of degrees to consider
data_prep Logical; if TRUE, performs data preparation steps.
... Additional arguments passed to ‘ggplot2’ functions.

Value

A ggplot object containing the correlation plot.

ggRelatednessMatrix *Plot a relatedness matrix as a heatmap (ggpedigree style)*

Description

Plots a relatedness matrix using ggplot2 with config options.

Usage

```
ggRelatednessMatrix(
  mat,
  config = list(),
  interactive = FALSE,
  tooltip_columns = NULL,
  personID = "personID",
  ...
)

ggrrelatednessmatrix(
  mat,
  config = list(),
  interactive = FALSE,
  tooltip_columns = NULL,
  personID = "personID",
  ...
)
```

Arguments

<code>mat</code>	A square numeric matrix of relatedness values (precomputed, e.g., from <code>ped2add</code>).
<code>config</code>	A list of graphical and display parameters. See Details for available options.
<code>interactive</code>	Logical; if TRUE, returns an interactive plotly object.
<code>tooltip_columns</code>	A character vector of column names to include in tooltips.
<code>personID</code>	Character; name of the column containing unique person identifiers.
<code>...</code>	Additional arguments passed to ggplot2 layers.

Details

Config options include:

- `matrix_color_palette`** A vector of colors for the heatmap (default: Reds scale)
- `color_scale_midpoint`** Numeric midpoint for diverging color scale (default: 0.25)
- `plot_title`** Plot title
- `matrix_cluster`** Logical; should rows/cols be clustered (default: TRUE)
- `axis_x_label, axis_y_label`** Axis labels
- `axis_text_size`** Axis text size

Value

A ggplot object displaying the relatedness matrix as a heatmap.

Examples

```
# Example relatedness matrix
set.seed(123)
mat <- matrix(runif(100, 0, 1), nrow = 10)
rownames(mat) <- paste0("ID", 1:10)
colnames(mat) <- paste0("ID", 1:10)

# Plot the relatedness matrix
ggRelatednessMatrix(mat,
  config = list(
    matrix_color_palette = c("white", "gold", "red"),
    color_scale_midpoint = 0.5,
    matrix_cluster = TRUE,
    plot_title = "Relatedness Matrix",
    axis_x_label = "Individuals",
    axis_y_label = "Individuals",
    axis_text_size = 8
  )
)
```

plotPedigree

plotPedigree A wrapped function to plot simulated pedigree from function *simulatePedigree*. This function require the installation of package *kinship2*.

Description

plotPedigree A wrapped function to plot simulated pedigree from function *simulatePedigree*. This function require the installation of package *kinship2*.

Usage

```
plotPedigree(
  ped,
  code_male = NULL,
  verbose = FALSE,
  affected = NULL,
  cex = 0.5,
  col = 1,
  symbolsize = 1,
  branch = 0.6,
  packed = TRUE,
  align = c(1.5, 2),
  width = 8,
  density = c(-1, 35, 65, 20),
  mar = c(2.1, 1, 2.1, 1),
  angle = c(90, 65, 40, 0),
  keep.par = FALSE,
  pconnect = 0.5,
  ...
)
```

Arguments

ped	The simulated pedigree data.frame from function <i>simulatePedigree</i> . Or a pedigree dataframe with the same colnames as the dataframe simulated from function <i>simulatePedigree</i> .
code_male	This optional input allows you to indicate what value in the sex variable codes for male. Will be recoded as "M" (Male). If NULL, no recoding is performed.
verbose	logical If TRUE, prints additional information. Default is FALSE.
affected	This optional parameter can either be a string specifying the column name that indicates affected status or a numeric/logical vector of the same length as the number of rows in 'ped'. If NULL, no affected status is assigned.
cex	The font size of the IDs for each individual in the plot.
col	color for each id. Default assigns the same color to everyone.

symbolsize	controls symbolsize. Default=1.
branch	defines how much angle is used to connect various levels of nuclear families.
packed	default=T. If T, uniform distance between all individuals at a given level.
align	these parameters control the extra effort spent trying to align children underneath parents, but without making the pedigree too wide. Set to F to speed up plotting.
width	default=8. For a packed pedigree, the minimum width allowed in the realignment of pedigrees.
density	defines density used in the symbols. Takes up to 4 different values.
mar	margin parameters, as in the par function
angle	defines angle used in the symbols. Takes up to 4 different values.
keep.par	Default = F, allows user to keep the parameter settings the same as they were for plotting (useful for adding extras to the plot)
pconnect	when connecting parent to children the program will try to make the connecting line as close to vertical as possible, subject to it lying inside the endpoints of the line that connects the children by at least pconnect people. Setting this option to a large number will force the line to connect at the midpoint of the children.
...	Extra options that feed into the plot function.

Value

A plot of the provided pedigree

redsquirrels

*Kluane Red Squirrel Data***Description**

A tidy data frame of life-history and reproductive metrics for 7,799 individual red squirrels from the Kluane Red Squirrel Project (1987–present). Each row corresponds to one squirrel with associated pedigree links and reproductive success summaries. The original data are published under a CC0 1.0 Universal Public Domain Dedication:

Usage

```
data(redsquirrels)
```

Format

‘redsquirrels’ A data frame with 7799 rows and 16 columns:

personID Unique identifier for each squirrel

momID, dadID Unique identifiers for each squirrel’s parents

sex Biological sex of the squirrel

famID Unique identifier for each family. Derived from ped2fam

byear Birth year of the squirrel
dyear Death year of the squirrel
lrs lifetime reproductive success for the squirrel
ars_mean Mean annual reproductive success for the squirrel
ars_max Maximum ARS value for the squirrel
ars_med Median ARS value for the squirrel
ars_min Minimum ARS value for the squirrel
ars_sd Standard deviation of ARS values for the squirrel
ars_n Number of ARS values for the squirrel
year_first First year of ARS data for the squirrel
year_last Last year of ARS data for the squirrel ...
