

Package ‘DeepLearningCausal’

January 20, 2025

Type Package

Title Causal Inference with Super Learner and Deep Neural Networks

Version 0.0.104

Maintainer Nguyen K. Huynh <khoinguyen.huynh@r.hit-u.ac.jp>

Description Functions to estimate Conditional Average Treatment Effects (CATE) and Population Average Treatment Effects on the Treated (PATT) from experimental or observational data using the Super Learner (SL) ensemble method and Deep neural networks. The package first provides functions to implement meta-learners such as the Single-learner (S-learner) and Two-learner (T-learner) described in Künzel et al. (2019) <[doi:10.1073/pnas.1804597116](https://doi.org/10.1073/pnas.1804597116)> for estimating the CATE. The S- and T-learner are each estimated using the SL ensemble method and deep neural networks. It then provides functions to implement the Ottoboni and Poulos (2020) <[doi:10.1515/jci-2018-0035](https://doi.org/10.1515/jci-2018-0035)> PATT-C estimator to obtain the PATT from experimental data with noncompliance by using the SL ensemble method and deep neural networks.

| | |
|--------------|--|
| complier_mod | <i>Train complier model using ensemble methods</i> |
|--------------|--|

Description

Train model using group exposed to treatment with compliance as binary outcome variable and covariates.

Usage

```
complier_mod(
  exp.data,
  complier.formula,
  treat.var,
  ID = NULL,
  SL.learners = c("SL.glmnet", "SL.xgboost", "SL.ranger", "SL.nnet", "SL.glm")
)
```

Arguments

| | |
|------------------|---|
| exp.data | list object of experimental data. |
| complier.formula | formula to fit compliance model ($c \sim x$) using complier variable and covariates |
| treat.var | string specifying the binary treatment variable |
| ID | string for name of identifier variable. |
| SL.learners | vector of strings for ML classifier algorithms. If left NULL employs extreme gradient boosting, elastic net regression, random forest, and neural nets. |

Value

model object of trained model.

complier_predict *Complier model prediction*

Description

Predict Compliance from control group in experimental data

Usage

```
complier_predict(complier.mod, exp.data, treat.var, compl.var)
```

Arguments

| | |
|--------------|---|
| complier.mod | output from trained ensemble superlearner model |
| exp.data | data.frame object of experimental dataset |
| treat.var | string specifying the binary treatment variable |
| compl.var | string specifying binary complier variable |

Value

data.frame object with true compliers, predicted compliers in the control group, and all compliers (actual + predicted).

exp_data

Survey Experiment of Support for Populist Policy

Description

Shortened version of survey response data that incorporates a vignette survey experiment. The vignette describes an international crisis between country A and B. After reading this vignette, respondents are randomly assigned to the control group or to one of two treatments: policy prescription to said crisis by strong (populist) leader and centrist (non-populist) leader. The respondents are then asked whether they are willing to support the policy decision to fight a war against country A, which is the dependent variable.

Usage

```
data(exp_data)
```

Format

exp_data:

A data frame with 257 rows and 12 columns:

female Gender.

age Age of participant.

income Monthly household income.

religion Religious denomination

practicing_religion Importance of religion in life.

education Educational level of participant.

political_ideology Political ideology of participant.

employment Employment status of participant.

marital_status Marital status of participant.

job_loss Concern about job loss.

strong_leader Binary treatment measure of leader type.

support_war Binary outcome measure for willingness to fight war. #? ...

Source

Yadav and Mukherjee (2024)

`exp_data_full`*Survey Experiment of Support for Populist Policy*

Description

Extended experiment data with 514 observations

Usage

```
data(exp_data_full)
```

Format

`exp_data_full`:

A data frame with 514 rows and 12 columns:

female Gender.

age Age of participant.

income Monthly household income.

religion Religious denomination

practicing_religion Importance of religion in life.

education Educational level of participant.

political_ideology Political ideology of participant.

employment Employment status of participant.

marital_status Marital status of participant.

job_loss Concern about job loss.

strong_leader Binary treatment measure of leader type.

support_war Binary outcome measure for willingness to fight war. #' ...

`metalearner_deepneural`*metalearner_deepneural*

Description

`metalearner_deepneural` implements the S-learner and T-learner for estimating CATE using Deep Neural Networks. The Resilient back propagation (Rprop) algorithm is used for training neural networks.

Usage

```
metalearner_deepneural(
  data,
  cov.formula,
  treat.var,
  meta.learner.type,
  stepmax = 1e+05,
  nfolds = 5,
  algorithm = "rprop+",
  hidden.layer = c(4, 2),
  linear.output = FALSE,
  binary.outcome = FALSE
)
```

Arguments

| | |
|--------------------------------|---|
| <code>data</code> | data.frame object of data. |
| <code>cov.formula</code> | formula description of the model $y \sim x$ (list of covariates). |
| <code>treat.var</code> | string for the name of treatment variable. |
| <code>meta.learner.type</code> | string specifying is the S-learner and "T.Learner" for the T-learner model. |
| <code>stepmax</code> | maximum number of steps for training model. |
| <code>nfolds</code> | number of folds for cross-validation. Currently supports up to 5 folds. |
| <code>algorithm</code> | a string for the algorithm for the neural network. Default set to rprop+, the Resilient back propagation (Rprop) with weight backtracking algorithm for training neural networks. |
| <code>hidden.layer</code> | vector of integers specifying layers and number of neurons. |
| <code>linear.output</code> | logical specifying regression (TRUE) or classification (FALSE) model. |
| <code>binary.outcome</code> | logical specifying predicted outcome variable will take binary values or proportions. |

Value

metalearner_deepneural of predicted outcome values and CATEs estimated by the meta learners for each observation.

Examples

```
# load dataset
data(exp_data)
# estimate CATEs with S Learner
set.seed(123456)
slearner_nn <- metalearner_deepneural(cov.formula = support_war ~ age + income +
  employed + job_loss,
  data = exp_data,
  treat.var = "strong_leader",
  meta.learner.type = "S.Learner",
```

```
        stepmax = 2e+9,
        nfolds = 5,
        algorithm = "rprop+",
        hidden.layer = c(1),
        linear.output = FALSE,
        binary.outcome = FALSE)

print(slearner_nn)

# load dataset
set.seed(123456)
# estimate CATEs with T Learner
tlearner_nn <- metalearner_deepneural(cov.formula = support_war ~ age +
  income +
  employed + job_loss,
  data = exp_data,
  treat.var = "strong_leader",
  meta.learner.type = "T.Learner",
  stepmax = 1e+9,
  nfolds = 5,
  algorithm = "rprop+",
  hidden.layer = c(2,1),
  linear.output = FALSE,
  binary.outcome = FALSE)

print(tlearner_nn)
```

metalearner_ensemble *metalearner_ensemble*

Description

metalearner_ensemble implements the S-learner and T-learner for estimating CATE using the super learner ensemble method. The super learner in this case includes the following machine learning algorithms: extreme gradient boosting, glmnet (elastic net regression), random forest and neural nets.

Usage

```
metalearner_ensemble(
  data,
  cov.formula,
  treat.var,
  meta.learner.type,
  SL.learners = c("SL.glmnet", "SL.xgboost", "SL.ranger", "SL.nnet"),
  nfolds = 5,
  binary.outcome = FALSE
)
```

Arguments

| | |
|--------------------------------|---|
| <code>data</code> | data.frame object of data |
| <code>cov.formula</code> | formula description of the model $y \sim x$ (list of covariates) |
| <code>treat.var</code> | string for the name of treatment variable. |
| <code>meta.learner.type</code> | string specifying is the S-learner and "T.Learner" for the T-learner model. |
| <code>SL.learners</code> | vector for super learner ensemble that includes extreme gradient boosting, glm-net, random forest, and neural nets. |
| <code>nfolds</code> | number of folds for cross-validation. Currently supports up to 5 folds. |
| <code>binary.outcome</code> | logical specifying predicted outcome variable will take binary values or proportions. |

Value

metalearner_ensemble of predicted outcome values and CATEs estimated by the meta learners for each observation.

Examples

```
# load dataset
data(exp_data)
#load SuperLearner package
library(SuperLearner)
# estimate CATEs with S Learner
set.seed(123456)
slearner <- metalearner_ensemble(cov.formula = support_war ~ age +
                                income + employed + job_loss,
                                data = exp_data,
                                treat.var = "strong_leader",
                                meta.learner.type = "S.Learner",
                                SL.learners = c("SL.glm"),
                                nfolds = 5,
                                binary.outcome = FALSE)

print(slearner)

# estimate CATEs with T Learner
set.seed(123456)
tlearner <- metalearner_ensemble(cov.formula = support_war ~ age + income +
                                employed + job_loss,
                                data = exp_data,
                                treat.var = "strong_leader",
                                meta.learner.type = "T.Learner",
                                SL.learners = c("SL.xgboost", "SL.ranger",
                                                "SL.nnet"),
                                nfolds = 5,
                                binary.outcome = FALSE)

print(tlearner)
```

 neuralnet_complier_mod

Train compliance model using neural networks

Description

Train model using group exposed to treatment with compliance as binary outcome variable and covariates.

Usage

```
neuralnet_complier_mod(
  complier.formula,
  exp.data,
  treat.var,
  algorithm = "rprop+",
  hidden.layer = c(4, 2),
  ID = NULL,
  stepmax = 1e+08
)
```

Arguments

| | |
|------------------|---|
| complier.formula | formula for complier variable as outcome and covariates ($c \sim x$) |
| exp.data | data.frame for experimental data. |
| treat.var | string for treatment variable. |
| algorithm | string for algorithm for training neural networks. Default set to the Resilient back propagation with weight backtracking (rprop+). Other algorithms include backprop', rprop-', 'sag', or 'slr' (see neuralnet package). |
| hidden.layer | vector for specifying hidden layers and number of neurons. |
| ID | string for identifier variable |
| stepmax | maximum number of steps. |

Value

trained complier model object

```
neuralnet_pattc_counterfactuals
    Assess Population Data counterfactuals
```

Description

Create counterfactual datasets in the population for compliers and noncompliers. Then predict potential outcomes using trained model from `neuralnet_response_model`.

Usage

```
neuralnet_pattc_counterfactuals(
  pop.data,
  neuralnet.response.mod,
  ID = NULL,
  cluster = NULL,
  binary.outcome = FALSE
)
```

Arguments

| | |
|-------------------------------------|---|
| <code>pop.data</code> | population data. |
| <code>neuralnet.response.mod</code> | trained model from. <code>neuralnet_response_model</code> . |
| <code>ID</code> | string for identifier variable. |
| <code>cluster</code> | string for clustering variable (currently unused). |
| <code>binary.outcome</code> | logical specifying predicted outcome variable will take binary values or proportions. |

Value

data.frame of predicted outcomes of response variable from counterfactuals.

```
neuralnet_predict    Predicting Compliance from experimental data
```

Description

Predicting Compliance from control group experimental data

Usage

```
neuralnet_predict(neuralnet.complier.mod, exp.data, treat.var, compl.var)
```

Arguments

| | |
|------------------------|-------------------------------------|
| neuralnet.complier.mod | results from neuralnet_complier_mod |
| exp.data | data.frame of experimental data |
| treat.var | string for treatment variable |
| compl.var | string for compliance variable |

Value

data.frame object with true compliers, predicted compliers in the control group, and all compliers (actual + predicted).

neuralnet_response_model

Modeling Responses from experimental data Using Deep NN

Description

Model Responses from all compliers (actual + predicted) in experimental data using neural network.

Usage

```
neuralnet_response_model(
  response.formula,
  exp.data,
  neuralnet.compliers,
  compl.var,
  algorithm = "rprop+",
  hidden.layer = c(4, 2),
  stepmax = 1e+08
)
```

Arguments

| | |
|---------------------|--|
| response.formula | formula for response variable and covariates (y ~ x) |
| exp.data | data.frame of experimental data. |
| neuralnet.compliers | data.frame of compliers (actual + predicted) from neuralnet_predict. |
| compl.var | string of compliance variable |
| algorithm | neural network algorithm, default set to "rprop+". |
| hidden.layer | vector specifying hidden layers and number of neurons. |
| stepmax | maximum number of steps for training model. |

Value

trained response model object

pattc_counterfactuals *Assess Population Data counterfactuals*

Description

Create counterfactual datasets in the population for compliers and noncompliers. Then predict potential outcomes from counterfactuals.

Usage

```
pattc_counterfactuals(
  pop.data,
  response.mod,
  ID = NULL,
  cluster = NULL,
  binary.outcome = FALSE
)
```

Arguments

| | |
|----------------|--|
| pop.data | population dataset |
| response.mod | trained model from response_model. |
| ID | string fir identifier variable |
| cluster | string for clustering variable |
| binary.outcome | logical specifying whether predicted outcomes are proportions or binary (0-1). |

Value

data.frame object of predicted outcomes of counterfactual groups.

pattc_deepneural *Estimate PATT_C using Deep NN*

Description

estimates the Population Average Treatment Effect of the Treated from experimental data with noncompliers using Deep Neural Networks.

Usage

```

pattc_deepneural(
  response.formula,
  exp.data,
  pop.data,
  treat.var,
  compl.var,
  compl.algorithm = "rprop+",
  response.algorithm = "rprop+",
  compl.hidden.layer = c(4, 2),
  response.hidden.layer = c(4, 2),
  compl.stepmax = 1e+08,
  response.stepmax = 1e+08,
  ID = NULL,
  cluster = NULL,
  binary.outcome = FALSE,
  bootstrap = FALSE,
  nboot = 1000
)

```

Arguments

| | |
|-----------------------|---|
| response.formula | formula of response variable as outcome and covariates ($y \sim x$) |
| exp.data | data.frame of experimental data. Must include binary treatment and compliance variables. |
| pop.data | data.frame of population data. Must include binary compliance variable |
| treat.var | string for treatment variable. |
| compl.var | string for compliance variable |
| compl.algorithm | string for algorithm to train neural network for compliance model. Default set to "rprop+". See (neuralnet package for available algorithms). |
| response.algorithm | string for algorithm to train neural network for response model. Default set to "rprop+". See (neuralnet package for available algorithms). |
| compl.hidden.layer | vector for specifying hidden layers and number of neurons in complier model. |
| response.hidden.layer | vector for specifying hidden layers and number of neurons in response model. |
| compl.stepmax | maximum number of steps for complier model |
| response.stepmax | maximum number of steps for response model |
| ID | string for identifier variable |
| cluster | string for cluster variable. |

```

                                nboot = 2000)

print(pattc_neural_boot)

```

pattc_ensemble *PATT_C SL Ensemble*

Description

pattc_ensemble estimates the Population Average Treatment Effect of the Treated from experimental data with noncompliers using the super learner ensemble that includes extreme gradient boosting, glmnet (elastic net regression), random forest and neural nets.

Usage

```

pattc_ensemble(
  response.formula,
  exp.data,
  pop.data,
  treat.var,
  compl.var,
  compl.SL.learners = c("SL.glmnet", "SL.xgboost", "SL.ranger", "SL.nnet", "SL.glm"),
  response.SL.learners = c("SL.glmnet", "SL.xgboost", "SL.ranger", "SL.nnet", "SL.glm"),
  ID = NULL,
  cluster = NULL,
  binary.outcome = FALSE,
  bootstrap = FALSE,
  nboot = 1000
)

```

Arguments

| | |
|-------------------|---|
| response.formula | formula for the effects of covariates on outcome variable ($y \sim x$). |
| exp.data | data.frame object for experimental data. Must include binary treatment and compliance variable. |
| pop.data | data.frame object for population data. Must include binary compliance variable. |
| treat.var | string for binary treatment variable. |
| compl.var | string for binary compliance variable. |
| compl.SL.learners | vector of names of ML algorithms used for compliance model. |

pop_data

World Value Survey India Sample

Description

World Value Survey (WVS) Data for India in 2022. The variables drawn from the said WVS India data match the covariates from the India survey experiment sample.

Usage

```
data(pop_data)
```

Format

pop_data:

A data frame with 846 rows and 13 columns:

female Respondent's Sex.

age Age of respondent.

income income group of Household.

religion Religious denomination

practicing_religion Importance of religion in respondent's life.

education Educational level of respondent.

political_ideology Political ideology of respondent.

employment Employment status and full-time employee.

marital_status Marital status of respondent.

job_loss Concern about job loss.

support_war Binary (Yes/No) outcome measure for willingness to fight war.

strong_leader Binary measure of preference for strong leader. ...

| | |
|---------------|--|
| pop_data_full | <i>World Value Survey India Sample</i> |
|---------------|--|

Description

Extended World Value Survey (WVS) Data for India in 1995, 2001, 2006, 2012, and 2022.

Usage

```
data(pop_data_full)
```

Format

pop_data_full:

A data frame with 11,813 rows and 13 columns:

female Respondent's Sex.

age Age of respondent.

income income group of Household.

religion Religious denomination

practicing_religion Importance of religion in respondent's life.

education Educational level of respondent.

political_ideology Political ideology of respondent.

employment Employment status and full-time employee.

marital_status Marital status of respondent.

job_loss Concern about job loss.

support_war Binary (Yes/No) outcome measure for willingness to fight war.

strong_leader Binary measure of preference for strong leader. ...

Description

Print method for `metalearner_ensemble`

Usage

```
## S3 method for class 'metalearner_ensemble'  
print(x, ...)
```

Arguments

`x` `metalearner_ensemble` class object from `metalearner_ensemble`
`...` additional parameter

Value

list of model results

```
print.pattc_deepneural  
print.pattc_deepneural
```

Description

Print method for pattc_deepneural

Usage

```
## S3 method for class 'pattc_deepneural'  
print(x, ...)
```

Arguments

| | |
|-----|---|
| x | pattc_deepneural class object from pattc_deepneural |
| ... | additional parameter |

Value

list of model results

```
print.pattc_ensemble print.pattc_ensemble
```

Description

Print method for pattc_ensemble

Usage

```
## S3 method for class 'pattc_ensemble'  
print(x, ...)
```

Arguments

| | |
|-----|---|
| x | pattc_ensemble class object from pattc_ensemble |
| ... | additional parameter |

Value

list of model results

| | |
|----------------|--|
| response_model | <i>Response model from experimental data using SL ensemble</i> |
|----------------|--|

Description

Train response model (response variable as outcome and covariates) from all compliers (actual + predicted) in experimental data using SL ensemble.

Usage

```
response_model(  
  response.formula,  
  exp.data,  
  compl.var,  
  exp.compliers,  
  family = "binomial",  
  ID = NULL,  
  SL.learners = c("SL.glmnet", "SL.xgboost", "SL.ranger", "SL.nnet", "SL.glm")  
)
```

Arguments

| | |
|------------------|---|
| response.formula | formula to fit the response model ($y \sim x$) using binary outcome variable and covariates |
| exp.data | experimental dataset. |
| compl.var | string specifying binary complier variable |
| exp.compliers | data.frame object of compliers from complier_predict. |
| family | string for "gaussian" or "binomial". |
| ID | string for identifier variable. |
| SL.learners | vector of names of ML algorithms used for ensemble model. |

Value

trained response model.
