

Package ‘KLINK’

January 20, 2025

Title Kinship Analysis with Linked Markers

Version 1.0.2

Description A 'shiny' application for forensic kinship testing, based on the 'pedsuite' R packages. 'KLINK' is closely aligned with the (non-R) software 'Familias' and 'FamLink', but offers several unique features, including visualisations and automated report generation. The calculation of likelihood ratios supports pairs of linked markers, and all common mutation models.

getLinkedPairs	<i>Identify linked marker pairs</i>
----------------	-------------------------------------

Description

This function returns a "maximal" set of disjoint pairs of linked markers, given a genetic marker map and a subset of the markers included in the map. The pairs are identified in a greedy manner, successively choosing the closest markers on each chromosome.

Usage

```
getLinkedPairs(markers, linkageMap, maxdist = Inf)
```

Arguments

markers	A character vector containing marker names.
linkageMap	A data frame with columns including Marker, Chrom and PosCM.
maxdist	A positive number indicating the maximum linkage distance (in cM). Markers further apart than this are considered unlinked.

Value

A list of character vectors, each containing two marker names.

Examples

```
# Example using the built-in map of 50 STR markers
map = KLINK::LINKAGEMAP

getLinkedPairs(map$Marker, map, maxdist = 25)
```

launchApp	<i>Launch KLINK</i>
-----------	---------------------

Description

This launches the KLINK app. runKLINK() is a synonym for launchApp(), but with an additional argument version.

Usage

```
launchApp()
```

```
runKLINK(version = NULL)
```

Arguments

version	A character, e.g. "1.0.0". If the installed version of KLINK differs from this, the program aborts with an error.
---------	---

Value

No return value, called for side effects.

Examples

```
## Not run:  
launchApp()  
  
## End(Not run)
```

LINKAGEMAP	<i>Built-in linkage map</i>
------------	-----------------------------

Description

A genetic map including 50 autosomal STR markers.

Usage

```
LINKAGEMAP
```

Format

A data frame with 50 rows and 4 columns: Marker, Kit, Chrom, PosCM.

linkedLR

LR with pairwise linked markers

Description

This function does the main LR calculations of the KLINK app.

Usage

```
linkedLR(
  pedigrees,
  linkageMap,
  linkedPairs = NULL,
  maxdist = Inf,
  markerData = NULL,
  mapfun = "Kosambi",
  lumpSpecial = TRUE
)
```

Arguments

pedigrees	A list of two pedigrees.
linkageMap	A data frame with columns including Marker, Chrom and PosCM.
linkedPairs	A list of marker pairs. If not supplied, calculated as <code>getLinkedPairs(markerData\$Marker, linkageMap, maxdist = maxdist)</code> .
maxdist	A number, passed onto <code>getLinkedMarkers()</code> if <code>linkedPairs</code> is NULL.
markerData	A data frame with marker data, typically the output of <code>markerSummary(pedigrees)</code> .
mapfun	Name of the map function to be used; either "Haldane" or "Kosambi" (default).
lumpSpecial	A logical, by default TRUE.

Value

A data frame with detailed LR results.

Examples

```
library(forrel)

ped1 = nuclearPed(fa = "AF", child = "CH") |>
  profileSim(markers = NorwegianFrequencies)

ped2 = singletons(c("AF", "CH")) |>
  transferMarkers(from = ped1, to = _)

pedigrees = list(ped1, ped2)
```

```

linkedLR(pedigrees, KLINK::LINKAGEMAP)

# For testing
# .linkedLR(pedigrees, markerpair = c("SE33", "D6S474"), linkageMap = LINKAGEMAP)

```

loadFamFile	<i>Load .fam file</i>
-------------	-----------------------

Description

Load .fam file

Usage

```
loadFamFile(path, fallbackModel = "equal", withParams = FALSE)
```

Arguments

path	The path to a .fam file.
fallbackModel	The name of a mutation model; passed on to <code>pedFamiliias::readFam()</code> .
withParams	A logical indicating if the Familias parameters should be included in the output. (See <code>pedFamiliias::readFam()</code> .)

Value

A list of two ped objects.

Examples

```

fam = system.file("extdata/halfsib-test.fam", package = "KLINK")
peds = loadFamFile(fam)
pedtools::plotPedList(peds)

```

markerSummary	<i>Generate table of marker data</i>
---------------	--------------------------------------

Description

Generate table of marker data

Usage

```
markerSummary(pedigrees, replaceNames = FALSE)
```

Arguments

pedigrees A list of 2 pedigrees.
 replaceNames A logical, indicating if IDs should be changed to Person1, Person2, ...

Value

A data frame.

Examples

```
markerSummary(paternity)
```

parseXML	<i>Parse XML file associated with .fam file</i>
----------	---

Description

Parse XML file associated with .fam file

Usage

```
parseXML(xml)
```

Arguments

xml Path to a file with extension .xml.

Examples

```
# (No example included)
```

paternity	<i>Dataset for a paternity case</i>
-----------	-------------------------------------

Description

A list of two pedigrees forming the hypotheses in a paternity case: H1 (AF is the father of CH) and H2 (unrelated). AF and CH are genotyped with 11 markers, with allele frequencies from `forrel::NorwegianFrequencies`.

Usage

```
paternity
```

Format

A list of two pedigrees, named H1 and H2.

Examples

```
pedtools::plotPedList(paternity, marker = "SE33")
markerSummary(paternity)

forrel::kinshipLR(paternity)
```

writeResult	<i>Write data and results to Excel</i>
-------------	--

Description

This function produces an Excel document containing the genotype data and various LR tables.

Usage

```
writeResult(
  resultTable,
  pedigrees,
  linkageMap,
  markerData,
  outfile,
  notes = NULL,
  famname = NULL,
  settings = NULL,
  XML = NULL
)
```

Arguments

resultTable	A data frame.
pedigrees	A list of two ped objects.
linkageMap	A data frame.
markerData	A data frame.
outfile	The output file name.
notes	A character vector.
famname	The name of the input .fam file.
settings	A list of KLINK settings to be included in the output
XML	Optional data from .xml file.

Examples

```
# Built-in dataset `paternity`
peds = paternity
map = LINKAGEMAP
mdata = markerSummary(peds)

# Result table
LRtab = linkedLR(pedigrees = peds, linkageMap = map, markerData = mdata)

# Write to excel
tmp = paste0(tempfile(), ".xlsx")
writeResult(LRtab,
            pedigrees = peds,
            linkageMap = map,
            markerData = mdata,
            outfile = tmp)

# openxlsx::openXL(tmp)
```
