Package 'manydata'

March 21, 2025

Title A Portal for Global Governance Data

```
Version 1.0.1
Date 2025-03-21
Description This is the core package for the many packages universe.
      It includes functions to help researchers work with and contribute to
      event datasets on global governance.
License CC BY 4.0
URL https://manydata.ch/
BugReports https://github.com/globalgov/manydata/issues
Depends R (>= 3.5.0), cli, dplyr, messydates (>= 0.5.0)
Imports dtplyr, ggplot2 (>= 3.4.0), httr, jsonlite, purrr, remotes,
      stringr, tidyr
Suggests testthat, readr, knitr, rmarkdown, ggVennDiagram, manynet,
Encoding UTF-8
LazyData true
RoxygenNote 7.3.2

	call_packages																		

Description

call_packages() finds and download other packages that belong to the many universe of packages. It allows users to rapidly access the names and other descriptive information of these packages. If users intend to download and install a package listed, they can type the package name within the function.

Usage

```
call_packages(package, develop = FALSE)
```

Arguments

package	A character vector of package name. For multiple packages, please declare package names as a vector (e.g. c("package1", "package2")).
develop	Would you like to download the develop version of the package? FALSE by default.

call_releases 3

Value

call_packages() returns a tibble with the 'many packages' currently available. If one or more package names are provided, these will be installed from Github.

See Also

```
Other call_: call_releases(), call_treaties()
```

Examples

```
#call_packages()
#call_packages("manyenviron")
```

call_releases

Call releases historical milestones/releases

Description

The function will take a data frame that details this information, or more usefully, a Github repository listing.

Usage

```
call_releases(repo, begin = NULL, end = NULL)
```

Arguments

	411411-		4	"globalgov/manvdata"
repo	ine oiiniin	renognary to	Track e o	- GIODAIGOV/MADVOAIA

begin When to begin tracking repository milestones. By default NULL, two months

before the first release.

end When to end tracking repository milestones. By default NULL, two months

after the latest release.

Details

The function creates a project timeline graphic using ggplot2 with historical milestones and milestone statuses gathered from a specified GitHub repository.

Value

A ggplot graph object

Source

https://benalexkeen.com/creating-a-timeline-graphic-using-r-and-ggplot2/

4 call_treaties

See Also

```
Other call_: call_packages(), call_treaties()
```

Examples

```
#call_releases("globalgov/manydata")
#call_releases("manypkgs")
```

call_sources

Call sources and citations

Description

These functions call any source or citation information that is available for a datacube or dataset. The function can be used on its own to the console, called during another function call such as consolidate() or pluck(), or is used to automatically and consistently populate help files.

Usage

```
call_sources(x)
call_citations(x, output = c("console", "help"))
```

Arguments

x A datacube or datasetoutput Whether the output should be formatted for "console" or the "help" page.

call_treaties

Call treaties from 'many' datasets

Description

Call treaties from 'many' datasets

Usage

```
call_treaties(
  dataset,
  treaty_type = NULL,
  variable = NULL,
  actor = NULL,
  key = "manyID"
)
```

call_treaties 5

Arguments

dataset A dataset in a datacube from one of the many packages. NULL by default. That is, all datasets in the datacube are used. For multiple datasets, please declare datasets as a vector (e.g. c("dataset1", "dataset2")). The type of treaties to be returned. NULL, by default. Other options are "bilattreaty_type eral" or "multilateral". variable Would you like to get one, or more, specific variables present in one or more datasets in the 'many' datacube? NULL by default. For multiple variables, please declare variable names as a vector. An actor variable in dataset. NULL by default. If declared, a tibble of the treaties actor and their member actors is returned. A variable key to join datasets. 'manyID' by default. key

Details

Certain datasets, or consolidated datacubes, in 'many' packages contains information on treaties which can be retrieved with call_treaties().

Value

call_treaties() returns a tibble with a list of the agreements.

See Also

```
Other call_: call_packages(), call_releases()
```

```
membs <- dplyr::tibble(manyID = c("ROU-RUS[RFP]_1901A",</pre>
"ROU-RUS[RFP]_1901A", "GD16FI_1901A"),
stateID = c("ROU", "RUS", "DNK"),
Title = c("Convention Between Roumania And Russia Concerning Fishing
In The Danube And The Pruth",
"Convention Between Roumania And Russia Concerning Fishing
In The Danube And The Pruth".
"Convention Between The Governments Of Denmark And
The United Kingdom Of Great Britain
And Northern Ireland For Regulating The Fisheries
Of Their Respective Subjects Outside
Territorial Waters In The Ocean Surrounding The Faroe Islands"),
Begin = c("1901-02-22", "1901-02-22", "1901-06-24"))
call_treaties(membs)
call_treaties(membs, treaty_type = "bilateral",
variable = c("Title", "Begin"))
call_treaties(membs, variable = c("Title", "Begin"), actor = "stateID")
```

6 compare_categories

compare_categories

Compare categories in 'many' datacubes

Description

Compare categories in 'many' datacubes

Usage

```
compare_categories(
  datacube,
  dataset = "all",
  key = "manyID",
  variable = "all",
  category = "all"
)
```

Arguments

datacube A datacube from one of the many packages.

dataset A dataset in a datacube from one of the many packages. By default "all". That

is, all datasets in the datacube are used. To select two or more datasets, please

declare them as a vector.

key A variable key to join datasets. 'manyID' by default.

variable Would you like to focus on one, or more, specific variables present in one or

more datasets in the 'many' datacube? By default "all". For multiple variables,

please declare variable names as a vector.

category Would you like to focus on one specific code category? By default "all" are

returned. Other options include "confirmed", "unique", "missing", "conflict", or

"majority". For multiple variables, please declare categories as a vector.

Details

Confirmed values are the same in all datasets in datacube. Unique values appear once in datasets in datacube. Missing values are missing in all datasets in datacube. Conflict values are different in the same number of datasets in datacube. Majority values have the same value in multiple, but not all, datasets in datacube.

See Also

```
Other compare_: compare_dimensions(), compare_missing(), compare_overlap()
```

compare_dimensions 7

Examples

```
compare_categories(emperors, key = "ID")
compare_categories(datacube = emperors, dataset = c("wikipedia", "UNRV"),
key = "ID", variable = c("Beg", "End"), category = c("conflict", "unique"))
plot(compare_categories(emperors, key = "ID"))
plot(compare_categories(datacube = emperors, dataset = c("wikipedia", "UNRV"),
key = "ID", variable = c("Beg", "End"), category = c("conflict", "unique")))
```

compare_dimensions

Compare dimensions for 'many' data

Description

Compare dimensions for 'many' data

Usage

```
compare_dimensions(datacube, dataset = "all")
```

Arguments

datacube A datacube from one of the many packages.

dataset A dataset in a datacube from one of the many packages. By default, "all". That

is, all datasets in the datacube are used. To select two or more datasets, please

declare them as a vector.

Details

compare_dimensions() compares the number of observations, variables, the earliest date, and the latest date in all observations for datasets in a 'many' datacube.

Value

compare_dimensions() returns a tibble with information about each dataset including the number of observations, the number of variables, the earliest date, and the latest date in all observations.

See Also

```
Other compare_: compare_categories(), compare_missing(), compare_overlap()
```

```
compare_dimensions(emperors)
```

8 compare_missing

compare	mı:	SS1	ng

Compare missing observations for 'many' data

Description

Compare missing observations for 'many' data

Usage

```
compare_missing(datacube, dataset = "all", variable = "all")
```

Arguments

datacube A datacube from one of the many packages.

dataset A dataset in a datacube from one of the many packages. NULL by default. That

is, all datasets in the datacube are used. To select two or more datasets, please

declare them as a vector.

variable Would you like to focus on one, or more, specific variables present in one or

more datasets in the 'many' datacube? By default "all". For multiple variables,

please declare variable names as a vector.

Details

compare_missing() compares the missing observations for variables in each dataset in a 'many' datacube.

Value

compare_missing() returns a tibble with information about each dataset including the number of observations, the number of variables, the earliest date, and the latest date in all observations.

See Also

```
Other compare_: compare_categories(), compare_dimensions(), compare_overlap()
```

```
compare_missing(emperors)
plot(compare_missing(emperors))
```

compare_overlap 9

	-	
compare	OVER	an

Compare the overlap between datasets in 'many' datacubes

Description

Compare the overlap between datasets in 'many' datacubes

Usage

```
compare_overlap(datacube, dataset = "all", key = "manyID")
```

Arguments

datacube A datacube from one of the many packages.

dataset A dataset in a datacube from one of the many packages. By default "all". That

is, all datasets in the datacube are used. To select two or more datasets, please

declare them as a vector.

key A variable key to join datasets. 'manyID' by default.

Details

compare_overlap() compares the overlap between "key" observations in each dataset in a 'many' datacube.

Value

compare_overlap() returns a tibble with information about each dataset and the number of overlapping observations.

See Also

```
Other compare_: compare_categories(), compare_dimensions(), compare_missing()
```

```
compare_overlap(emperors, key = "ID")
plot(compare_overlap(emperors, key = "ID"))
```

10 consolidate

consolidate

Consolidate datacube into a single dataset

Description

This function consolidates a set of datasets in a 'many*' package datacube into a single dataset with some combination of the rows, columns, and observations of the datasets in the datacube.

Usage

```
consolidate(
  datacube,
  join = c("full", "inner", "left"),
  resolve = "coalesce",
  key = NULL
)
```

Arguments

datacube

A datacube from one of the many packages

join

Which join procedure to use. By default "full" so that all observations are retained, but other options include "left" for basing the consolidated dataset on observations present in the first dataset (reorder the datasets to favour another dataset), and "inner" for a consolidated dataset that includes only observations that are present in all datasets.

resolve

Choice how (potentially conflicting) values from shared variables should be resolved. Options include:

- "coalesce" (default): uses first non-NA value (if available) for each observation, essentially favouring the order the datasets are in in the datacube.
- "unite": combines the unique values for each observation across datasets as a set (separated by commas and surrounded by braces), which can be useful for retaining information.
- "random": selects values at random from among the observations from each dataset that observed that variable, of particular use for exploring the implications of dataset-related variation.
- "precise": selects the value that has the highest precision from among the observations from each dataset (see resolving_precision()), which favours more precise data.
- "min", "max": these options return the minimum or maximum values respectively, which can be useful for conservative temporal fixing.

To resolve variables by different functions, pass the argument a vector (e.g. resolve = c(var1 = "min", var2 = "max")). Unnamed variables will be resolved according to the default ("coalesce").

describe 11

key

An ID column to collapse by. By default "manyID". Users can also specify multiple key variables in a list. For multiple key variables, the key variables must be present in all the datasets in the datacube (e.g. key = c("key1", "key2")). For equivalent key columns with different names across datasets, matching is possible if keys are declared (e.g. key = c("key1" = "key2")). Missing observations in the key variable are removed.

Details

The function includes separate arguments for the rows and columns, as well as for how to resolve conflicts for observations across datasets. This provides users with considerable flexibility in how they combine data. For example, users may wish to stick to units that appear in every dataset but include variables coded in any dataset, or units that appear in any dataset but only those variables that appear in every dataset. Even then there may be conflicts, as the actual unit-variable observations may differ from dataset to dataset. We offer a number of resolve methods that enable users to choose how conflicts between observations are resolved.

Text variables are dropped for more efficient consolidation.

Value

A single tibble/data frame.

Examples

```
consolidate(emperors, join = "full", resolve = "coalesce", key = "ID")
consolidate(emperors, join = "inner", resolve = "min", key = "ID")
consolidate(emperors, join = "left", resolve = "max", key = "ID")
```

describe

Data reports for datacubes and datasets with 'mdate' variables

Description

These functions provide meta level descriptions of datacubes or datasets. mreport() creates a properly formatted data report for datasets which contain 'mdate' class objects, alongside other object classes. describe_datacube() prints a text description of the datasets in a datacube.

Usage

```
mreport(data)
describe_datacube(datacube)
```

Arguments

```
data A {tibble} or a {data.frame}.
```

datacube A datacube

12 emperors

Details

'mreport' displays the variable's name, the variable type, the number of observations per variable, the number of missing observations for variable, and the percentage of missing observations in variable.

Value

A data report of class 'mreport'.

Examples

mreport(emperors)

emperors

Emperors datacube documentation

Description

The emperors datacube is a list containing 3 datasets: Wikipedia, UNRV, and Britannica

Usage

emperors

Format

Wikipedia: A dataset with 68 observations and the following 15 variables: ID, Begin, End, Full-Name, Birth, Death, CityBirth, ProvinceBirth, Rise, Cause, Killer, Dynasty, Era, Notes, Verif.

UNRV: A dataset with 99 observations and the following 7 variables: ID, Begin, End, Birth, Death, FullName, Dynasty.

Britannica: A dataset with 87 observations and the following 3 variables: ID, Begin, End.

pluck

Selects a single dataset from a datacube

Description

This function is reexported/wrapped from the {purrr} package. It allows users to select a single dataset from one of the datacubes available across the 'many* packages'. It additionally invites users to cite the selected dataset.

recollect 15

Usage

```
pluck(.x, ..., .default = NULL)
```

Arguments

.x The datacube

... The name of the dataset in the datacube
.default Value to use if target is NULL or absent.

Value

The selected dataset

Examples

```
pluck(emperors, "UNRV")
```

recollect

Pastes unique string vectors

Description

For use with dplyr::summarise, for example

Usage

```
recollect(x, collapse = "_")
```

Arguments

x A vector

collapse String indicating how elements separated

Details

This function operates similarly to reunite, but instead of operating on columns/observations, it pastes together unique rows/observations.

Value

A single value

16 repaint

Examples

```
data <- data.frame(ID = c(1,2,3,3,2,1))
data1 <- data.frame(ID = c(1,2,3,3,2,1), One = c(1,NA,3,NA,2,NA))
recollect(data$ID)
recollect(data1$One)
```

repaint

Fills missing data by lookup

Description

Fills missing data where known by other observations with the same id/index

Usage

```
repaint(df, id, var)
```

Arguments

df	a dataframe
id	a string identifying a column in the dataframe for indexing
var	a string identifying a column or columns in the dataframe to be filled

Value

A dataframe

```
\label{eq:data} \begin{array}{ll} \mbox{data} \leftarrow \mbox{data.frame}(\mbox{ID} = \mbox{c}(1,2,3,3,2,1), \\ \mbox{One} = \mbox{c}(1,\mbox{NA},3,\mbox{NA},2,\mbox{NA}), \\ \mbox{Two} = \mbox{c}(\mbox{NA},"\mbox{B"},\mbox{NA},"\mbox{C"},\mbox{NA},"\mbox{A"})) \\ \mbox{repaint}(\mbox{data}, "\mbox{ID"}, \mbox{c}("\mbox{One"},"\mbox{Two"})) \end{array}
```

resolving 17

resolving

Resolving multiple observations of the same variable into one

Description

Resolving multiple observations of the same variable into one

Usage

```
resolve_coalesce(.data, vars)
resolve_unite(.data, vars)
resolve_min(.data, vars)
resolve_max(.data, vars)
resolve_random(.data, vars)
resolve_precision(.data, vars)
```

Arguments

vars A vector of variables from .data to be resolved or converged.

Unite

Note that uniting always returns a character/string vector. Values are separated by commas and a set is contained within braces.

18 transmutate

reunite

Pastes unique string vectors

Description

A vectorised function for use with dplyr's mutate, etc

Usage

```
reunite(..., sep = "_")
```

Arguments

... Variables to pass to the function, currently only two at a time sep Separator when vectors reunited, by default "_"

Value

A single vector with unique non-missing information

Examples

transmutate

Drop only columns used in formula

Description

A function between dplyr's transmute and mutate

Usage

```
transmutate(.data, ...)
```

Arguments

.data Data frame to pass to the function... Variables to pass to the function

Value

Data frame with mutated variables and none of the variables used in the mutations, but, unlike dplyr::transmute(), all other unnamed variables.

transmutate 19

Source

https://stackoverflow.com/questions/51428156/dplyr-mutate-transmute-drop-only-the-columns-used-in-the-formula

```
pluck(emperors, "Wikipedia")
transmutate(emperors$Wikipedia, Beginning = Begin)
```
