rainbow-package   *Rainbow Plots, Bagplots and Boxplots for Functional Data*

Description

This package presents the rainbow plots, bagplots and boxplots for functional data. The latter two can also be used to identify outliers, which have either the lowest depth or the lowest density, respectively.

Australiafertility   *Australian age-specific fertility data*

Description

Age-specific fertility rates between ages 15 and 49 in Australia from 1921 to 2006.

The age-specific fertility rates can be smoothed using a weighted median smoothing B-splines, constrained to be concave.

Usage

```
data(Australiafertility)
data(Australiasmoothfertility)
```

Format

An object of class `fts`.

Details

Australian fertility rates and populations (1921-2006) for age groups (15-49) were obtained from the Australian Bureau of Statistics (Cat.No.3105.0.65.001, Table 38). These are defined as the number of live births during the calendar year, according to the age of the mother, per 1000 of the female resident population of the same age at 30 June.

Australiasmoothfertility is the smoothed version of Australiafertility data. The smoothing technique is the penalized regression spline with concave constraint, described in Hyndman and Ullah (2007).

ElNino_ERSST_region_1and2
                              Sea surface temperature data set from January 1950 to December 2018

Description

Sea surface temperature data set from January 1950 to December 2018 observed by the extended reconstructed sea surface temperature

Usage

```
data(ElNino_ERSST_region_1and2)
data(ElNino_ERSST_region_3)
data(ElNino_ERSST_region_4)
data(ElNino_ERSST_region_3and4)
```

Format

An object of class `sfts`.

Details

These averaged monthly sea surface temperatures are measured by the different moored buoys in the "Nino region" defined by the coordinates 0-10 degree South and 90-80 degree West.

Source

National Weather Service Climate Prediction Center website at http://www.cpc.ncep.noaa.gov/data/indices/sstoi.indices. The data is the third column with the title NINO1+2.

ElNino_OISST_region_1and2

Sea surface temperature data set from January 1982 to December 2018

Description

Monthly sea surface temperatures from January 1982 to December 2018 observed by the optimum interpolation sea surface temperature.

Usage

```
data(ElNino_OISST_region_1and2)
data(ElNino_OISST_region_3)
data(ElNino_OISST_region_4)
data(ElNino_OISST_region_3and4)
```

Format

An object of class `sfts`.

Details

fboxplot   *Functional bagplot and functional HDR boxplot*

Description

Compute bivariate bagplot, functional bagplot and bivariate HDR boxplot, functional HDR boxplot.

Usage

```
fboxplot(data, plot.type = c("functional", "bivariate"),
type = c("bag", "hdr"), alpha = c(0.05, 0.5), projmethod = c("PCAproj","rapca"),
factor = 1.96, na.rm = TRUE, xlab = data$xname, ylab = data$yname,
shadecols = gray((9:1)/10), pointcol = 1, plotlegend = TRUE,
legendpos = "topright", ncol = 2, ...)
```

Arguments

data	An object of class [fds] or fts.
plot.type	Version of boxplot. When plot.type="functional", a functional plot is provided. When plot.type="bivariate", a square bivariate plot is provided.
type	Type of boxplot. When type = "bag", a bagplot is provided. When type = "hdr", a HDR boxplot is provided.
alpha	Coverage probability for the functional HDR boxplot. α are the coverage percentages of the outliers and the central region.
factor	When type = "bag", the outer region of a bagplot is the convex hull obtained by inflating the inner region by the bagplot factor.
na.rm	Remove missing values.
xlab	A title for the x axis.
ylab	A title for the y axis.
shadecols	Colors for shaded regions.
pointcol	Color for outliers and mode.
plotlegend	Add a legend to the graph.
legendpos	Legend position. By default, it is the top right corner.
ncol	Number of columns in the legend.
projmethod	Method used for projection.
...	Other arguments.

Details

The functional curves are first projected into a finite dimensional subspace via functional principal component decomposition. For simiplicity, we choose the subspace as R^2. Based on Tukey (1974)'s halfspace bagplot and Hyndman (1996)'s HDR boxplot, we order each data point in R^2 by data depth and data density. Outliers are those that have either lowest depth (distance from the centre) or lowest density.

Value

Function produces a graphical plot.

fdepth	*Compute functional depth.*

Description

Compute functional depth.

Usage

```
fdepth(data, type = c("FM", "mode", "RP", "RPD", "radius"), trim = 0.25, alpha, weight)
```

Arguments

data	An object of class [fds](#) or fts.
type	Type of functional depth. See detail section below.
trim	Percentage of trimming.
alpha	Tuning parameter used when type = "radius".
weight	Hard-thresholding or soft-thresholding when type = "radius".

Details

If type = "FM", it computes the functional depth of Fraiman and Muniz (2001), which is considered as the first functional depth.

If type = "mode", it computes the functional depth of Cuevas et al. (2006). A functional mode is defined as the curve most densely surrounded by the rest of curves of the dataset.

If type = "RP" and type = "RPD", it computes random projection functional depth of Cuevas et al. (2007). Cuevas et al. (2007) considered the random projection depth based on measuring the depth of the functional data under projections and taking additional information of their derivatives. The basic idea is to project each functional curve, along a random direction, defining a point in R^2. A data depth in R^2 provides an order of the projected points.

If type = "radius", it ranks the curves according to alpha-radius. Then using the hard thresholding or soft thresholding, trimmed mean and median can be computed.

The argument trim = 0.25 first order curves by depth, and then trim 25 percent curves that have comparably lower depth.

Value

A list containing the following components is returned.

median	Median curve (highest depth).
lmed	Index of median curve.
ltrim	Indexes of the trimmed curves.
prof	Functional depth for each curve.
mtrim	Mean of trimmed curves.
weight	Weight values for all observations, when type = "radius".

fds *Create functional objects*

Description

The function fds is used to create general independent and identically distributed (i.i.d.) functional objects that are not ordered by time. The function fts is used to create functional time series objects. The function sfts is used to create sliced functional time series objects, where the x variable is also a time variable.

Usage

```
fds(x, y, xname, yname)
fts(x, y, start = 1, frequency = 1, xname, yname)
sfts(data, period = frequency(data), start = tsp(data)[1],
     frequency = 1, xname, yname)
```

Arguments

x	Numeric vector of length p.
y	Matrix of size $p \times n$ representing n functions of x observed at points $1, \ldots, p$.
data	An object of class [ts](#).
period	Time period of sliced functional data. For instance, period = 12 is a monthly data.
start	The time of the first observation. Either a single number or a vector of two integers, which specify a natural time unit and a (1-based) number of samples into the time unit. See [ts](#) for details.
frequency	The number of observations per unit of time.
xname	Character string giving name of x vector. (optional)
yname	Character string giving name of y vector. (optional)

Value

An object of class fds or fts or sfts.

Author(s)

Rob J Hyndman and Han Lin Shang

Examples

```
fds(x = 1:20, y = Simulationdata$y, xname = "x", yname = "Simulated value")
fts(x = 15:49, y = Australiasmoothfertility$y, xname = "Age",
    yname = "Fertility rate")
sfts(ts(as.numeric(ElNino_OISST_region_1and2$y), frequency = 12), xname = "Month",
     yname = "Sea surface temperature")
```

`foutliers`   *Functional outlier detection methods.*

Description

Functional outlier detection methods.

Usage

```
foutliers(data, method = c("robMah", "lrt", "depth.trim", "depth.pond",
  "HUoutliers"), dfunc = depth.mode, nb = 200, suav = 0.05, trim = 0.1,
   order = 2, lambda = 3.29,...)
```

Arguments

data	An object of class [fds](#) or fts.
method	Outlier detection method.
dfunc	When method = "lrt" or method = "depth.trim" or method = "depth.pond", users can specify the type of depth functions with possible choices of depth.FM, depth.mode, depth.RP, depth.RPD.
nb	When method = "lrt", users can specify the number of bootstrap samples.
suav	When method = "lrt", users can specify the smoothing parameter used in the smoothed bootstrap samples to determine the cutoff value.
trim	When method = "lrt" or method = "depth.trim" or method = "depth.pond", users can specify the trimming percentage.
order	When method = "HUoutliers", users can specify the number of principal components.
lambda	When method = "HUoutliers", users can specify the value of tuning parameter.
...	Other arguments.

Details

When method = "lrt", the outlier detection method corresponds to the approach of Febrero et al. (2007) using the likelihood ratio test.

When method = "depth.trim", the outlier detection method corresponds to the approach of Febrero et al. (2008) using the functional depth with trimmed curves.

When method = "depth.pond", the outlier detection method corresponds to the approach of Febrero et al. (2008) using the functional depth with all curves.

When method = "HUoutliers", the outlier detection method corresponds to the approach of Hyndman and Ullah (2008) using the integrated square forecast errors.

When method = "robMah", the outlier detection method corresponds to the approach of Rousseeuw and Leroy (1987) using the robust Mahalanobis distance.

Value

A list containing the following components is returned.

`outliers`	Detected outliers.
`cutoff`	Threshold value to separate outliers from non-outliers, when `method = "lrt"`, `method = "depth.trim"`, and `method = "depth.pond"`.
`depth.total`	Depth measure of each functional curve.
`depth.out`	Depth measure of functional outliers.

plot.fdepth	*Plot functional depth*

Description

Plot functional depth.

Usage

```
## S3 method for class 'fdepth'
plot(x, show.legend = TRUE, pos.legend = "bottomleft", ...)
```

Arguments

x	An object of class [fdepth]().
show.legend	Is legend required in the plot?
pos.legend	When show.legend = TRUE, users can specify the position of the legend.
...	Other plotting parameters passed to [par]().

Value

Function produces a plot.

Author(s)

Rob J Hyndman, Han Lin Shang

References

```
plot(fdepth(ElNino_OISST_region_1and2))
```

---

plot.fds	*Plot functional objects*

Description

Plot functional curves.

Usage

```
## S3 method for class 'fds'
plot(x, plot.type = c("functions", "time", "depth", "density"),
  col = NULL, type = "l", lty = 1, xlab = x$xname, ylab = x$yname,
  pch = c(1:9,0, letters, LETTERS), add = FALSE, index,
  colorchoice = c("rainbow", "heat.colors", "terrain.colors",
  "topo.colors", "cm.colors", "rainbow_hcl", "gray", "sequential_hcl",
  "heat_hcl", "terrain_hcl", "diverge_hcl"), plotlegend = FALSE,
  legendpos = "topright", ncol = 1, ...)
## S3 method for class 'fds'
lines(x, type = "l", index, ...)
## S3 method for class 'fds'
points(x, type = "p", index, ...)
```

Arguments

x	An object of class [fds](#) or fts.
plot.type	Type of plot. See details for more explanations.
col	Colors to use in plot. Default in plot.fds is to use a rainbow color palette with the number of colors equal to the number of functions.
type	1-character string giving the type of plot desired.
lty	The line type.
xlab	A title for x axis.
ylab	A title for y axis.
pch	Either an integer specifying a symbol or a single character to be used as the default in plotting points.
add	If add = TRUE, it plots a line or points.
index	Index of a specific curve that is plotted as a line or points.
colorchoice	Color palette used for drawing the rainbow plot.
plotlegend	Add a legend to the graph.
legendpos	Position of legend.
ncol	Number of column in the legend.
...	Other plotting parameters passed to [par](#).

Details

If plot.type = "functions", then functions are plotted using a rainbow color palette so the first few functions are shown in red, followed by orange, yellow, green, blue and indigo with the last few functions plotted in violet.

If plot.type = "time", then each value of x is shown as a separate time series in a time plot.

If plot.type = "depth", then functions are first ordered by depth and then plotted using a rainbow color palette.

If plot.type = "density", then functions are first ordered by density and then plotted using a rainbow color palette.

Value

Function produces a plot.

Simulationdata   *Simulated data*

Description

Simulated data used in Hyndman and Shang (2008).

Usage

```
data(Simulationdata)
```

Format

An object of class [fds]().

References

summaryfunction   *Summary statistics for functional data*

Description

Display summary statistics (minimum, 1st quantile, median, mean, 3rd quantile, maximum) and quantiles of functional data

Usage

```
summaryfunction(ftsdata, plot.type = c("summarystats", "quantilestats"),
 quantilepercent = seq(0.1, 0.9, by = 0.1), plot.legend = FALSE,
  legendpos = "topright", cex = 0.9, lwd = 1, lty = 1, ncol = 2)
```

Arguments

`ftsdata`	An object of class [fds]().
`plot.type`	Summary statistics or quantiles.
`quantilepercent`	
	Percentage of quantiles.
`plot.legend`	Is the legend required in the plot?
`legendpos`	When the `plot.legend = TRUE`, position of the legend.
`cex`	When the `plot.legend = TRUE`, point size.
`lwd`	When the `plot.legend = TRUE`, width of line.
`lty`	When the `plot.legend = TRUE`, line type.
`ncol`	When the `plot.legend = TRUE`, number of columns in the legend.

Details

A function for displaying summary statistics or quantiles of functional data.

Value

Return a plot of summary statistics of functional data or a plot of quantiles of functional data.

SVDplot	*Singular value decomposition plot*

Description

The singular value decomposition (SVD) plot of Zhang et al. (2007) captures the changes in the singular columns as the number of curves gradually increases.

Usage

```
SVDplot(object, order = 3, plot = TRUE, plot.type = c("fts", "image"),
        mfrow = c(2, 3))
```

Arguments

`object`	An object of `fds`.
`order`	Number of Singular Value Decomposition (SVD) components. The maximum order is 4.
`plot`	Is graphical display required?
`plot.type`	Plot functional time series or images?
`mfrow`	Grid of graphics.

Details

By using the SVD, Zhang et al. (2007) proposed a plot for visualizing patterns of functional time series. They considered a set of curves as a two-way (p * n) data matrix, where p is the total number of covariates and n is the total number of curves.

The main advantage of this dynamic plot is to visualize both column and row information of a two-way matrix simultaneously, relate the matrix to the corresponding curves, show local variations, and highlight interactions between columns and rows of a two-way matrix.

Value

When `plot = TRUE`, it returns a plot.

When `plot = FALSE`, it returns the following:

`svds`	A number of singular value decomposition ordered by the amount of explained variation.
`reconstruction`	Reconstruction of the original data using the SVD.
`residual`	Residual of the original data.

Note

MATLAB code is available at https://www.stat.purdue.edu/~lingsong/.

Using the animate package of Grahn(2011), a set of dynamic movies can be created to visualize the changes in singular rows and singular columns.
