accessanalyzer

Access Analyzer

Description

Index

Identity and Access Management Access Analyzer helps you to set, verify, and refine your IAM policies by providing a suite of capabilities. Its features include findings for external and unused access, basic and custom policy checks for validating policies, and policy generation to generate fine-grained policies. To start using IAM Access Analyzer to identify external or unused access, you first need to create an analyzer.

External access analyzers help identify potential risks of accessing resources by enabling you to identify any resource policies that grant access to an external principal. It does this by using logic-based reasoning to analyze resource-based policies in your Amazon Web Services environment. An external principal can be another Amazon Web Services account, a root user, an IAM user or role, a federated user, an Amazon Web Services service, or an anonymous user. You can also use IAM Access Analyzer to preview public and cross-account access to your resources before deploying permissions changes.

Unused access analyzers help identify potential identity access risks by enabling you to identify unused IAM roles, unused access keys, unused console passwords, and IAM principals with unused service and action-level permissions.

Beyond findings, IAM Access Analyzer provides basic and custom policy checks to validate IAM policies before deploying permissions changes. You can use policy generation to refine permissions by attaching a policy generated using access activity logged in CloudTrail logs.

This guide describes the IAM Access Analyzer operations that you can call programmatically. For general information about IAM Access Analyzer, see Identity and Access Management Access Analyzer in the IAM User Guide.

Usage

```
accessanalyzer(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret access key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- accessanalyzer(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  endpoint = "string",
```

```
region = "string"
```

Operations

apply_archive_rule Retroactively applies the archive rule to existing findings that meet the archive rule criter

Cancels the requested policy generation cancel_policy_generation

check_access_not_granted Checks whether the specified access isn't allowed by a policy

check_no_new_access Checks whether new access is allowed for an updated policy when compared to the exist check_no_public_access Checks whether a resource policy can grant public access to the specified resource type Creates an access preview that allows you to preview IAM Access Analyzer findings for create_access_preview

Creates an analyzer for your account create_analyzer

create_archive_rule Creates an archive rule for the specified analyzer

delete_analyzer Deletes the specified analyzer delete_archive_rule Deletes the specified archive rule

generate_finding_recommendation Creates a recommendation for an unused permissions finding

Retrieves information about an access preview for the specified analyzer get_access_preview

get_analyzed_resource Retrieves information about a resource that was analyzed get_analyzer Retrieves information about the specified analyzer get_archive_rule Retrieves information about an archive rule get_finding Retrieves information about the specified finding

get_finding_recommendation Retrieves information about a finding recommendation for the specified analyzer

get_finding_v2 Retrieves information about the specified finding

get_generated_policy Retrieves the policy that was generated using StartPolicyGeneration

Retrieves a list of access preview findings generated by the specified access preview list_access_preview_findings

Retrieves a list of access previews for the specified analyzer

list_access_previews

Retrieves a list of resources of the specified type that have been analyzed by the specified

list_analyzers Retrieves a list of analyzers

list_archive_rules Retrieves a list of archive rules created for the specified analyzer list_findings Retrieves a list of findings generated by the specified analyzer Retrieves a list of findings generated by the specified analyzer list_findings_v2 list_policy_generations Lists all of the policy generations requested in the last seven days

list_tags_for_resource Retrieves a list of tags applied to the specified resource

Starts the policy generation request start_policy_generation

start_resource_scan Immediately starts a scan of the policies applied to the specified resource

Adds a tag to the specified resource tag_resource Removes a tag from the specified resource untag_resource Modifies the configuration of an existing analyzer $update_analyzer$

update_archive_rule Updates the criteria and values for the specified archive rule

update_findings Updates the status for the specified findings

validate_policy Requests the validation of a policy and returns a list of findings

Examples

```
## Not run:
svc <- accessanalyzer()</pre>
```

list_analyzed_resources

account 7

```
svc$apply_archive_rule(
  Foo = 123
)
## End(Not run)
```

account

AWS Account

Description

Operations for Amazon Web Services Account Management

Usage

```
account(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token

8 account

- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint Optional shorthand for complete URL to use for the constructed client.

region Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- account(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
   ),
    profile = "string",
   anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

acm 9

accept_primary_email_update
delete_alternate_contact
disable_region
enable_region
get_alternate_contact
get_contact_information
get_primary_email
get_region_opt_status
list_regions
put_alternate_contact
put_contact_information
start_primary_email_update

Accepts the request that originated from StartPrimaryEmailUpdate to update the primary ema

Deletes the specified alternate contact from an Amazon Web Services account

Disables (opts-out) a particular Region for an account Enables (opts-in) a particular Region for an account

Retrieves the specified alternate contact attached to an Amazon Web Services account

Retrieves the primary contact information of an Amazon Web Services account

Retrieves the primary email address for the specified account

Retrieves the opt-in status of a particular Region

Lists all the Regions for a given account and their respective opt-in statuses

Modifies the specified alternate contact attached to an Amazon Web Services account

Updates the primary contact information of an Amazon Web Services account Starts the process to update the primary email address for the specified account

Examples

```
## Not run:
svc <- account()
svc$accept_primary_email_update(
   Foo = 123
)
## End(Not run)</pre>
```

acm

AWS Certificate Manager

Description

Certificate Manager

You can use Certificate Manager (ACM) to manage SSL/TLS certificates for your Amazon Web Services-based websites and applications. For more information about using ACM, see the Certificate Manager User Guide.

Usage

```
acm(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key

10 acm

- * session_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- acm(
  config = list(
    credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
    ),
  endpoint = "string",
  region = "string",</pre>
```

11 acm

```
close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string";
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

add_tags_to_certificate delete certificate describe_certificate export_certificate get_account_configuration get_certificate import certificate list certificates list_tags_for_certificate put_account_configuration remove_tags_from_certificate renew_certificate request_certificate resend_validation_email update_certificate_options

Adds one or more tags to an ACM certificate Deletes a certificate and its associated private key

Returns detailed metadata about the specified ACM certificate

Exports a private certificate issued by a private certificate authority (CA) for use anywhere Returns the account configuration options associated with an Amazon Web Services account

Retrieves a certificate and its certificate chain

Imports a certificate into Certificate Manager (ACM) to use with services that are integrated v

Retrieves a list of certificate ARNs and domain names Lists the tags that have been applied to the ACM certificate Adds or modifies account-level configurations in ACM Remove one or more tags from an ACM certificate

Renews an eligible ACM certificate

Requests an ACM certificate for use with other Amazon Web Services services

Resends the email that requests domain ownership validation

Updates a certificate

Examples

```
## Not run:
svc <- acm()</pre>
svc$add_tags_to_certificate(
  Foo = 123
## End(Not run)
```

AWS Certificate Manager Private Certificate Authority

Description

This is the *Amazon Web Services Private Certificate Authority API Reference*. It provides descriptions, syntax, and usage examples for each of the actions and data types involved in creating and managing a private certificate authority (CA) for your organization.

The documentation for each action shows the API request parameters and the JSON response. Alternatively, you can use one of the Amazon Web Services SDKs to access an API that is tailored to the programming language or platform that you prefer. For more information, see Amazon Web Services SDKs.

Each Amazon Web Services Private CA API operation has a quota that determines the number of times the operation can be called per second. Amazon Web Services Private CA throttles API requests at different rates depending on the operation. Throttling means that Amazon Web Services Private CA rejects an otherwise valid request because the request exceeds the operation's quota for the number of requests per second. When a request is throttled, Amazon Web Services Private CA returns a ThrottlingException error. Amazon Web Services Private CA does not guarantee a minimum request rate for APIs.

To see an up-to-date list of your Amazon Web Services Private CA quotas, or to request a quota increase, log into your Amazon Web Services account and visit the Service Quotas console.

Usage

```
acmpca(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.

acmpca 13

• sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

),
endpoint = "string",
region = "string"
)
```

Operations

create_certificate_authority create_certificate_authority_audit_report create_permission delete_certificate_authority delete_permission delete_policy describe_certificate_authority describe_certificate_authority_audit_report get_certificate get_certificate_authority_certificate get_certificate_authority_csr get policy import_certificate_authority_certificate issue certificate list_certificate_authorities list_permissions list_tags put_policy restore_certificate_authority revoke_certificate tag_certificate_authority untag_certificate_authority update_certificate_authority

Creates a root or subordinate private certificate authority (CA)

Creates an audit report that lists every time that your CA private key is used to is Grants one or more permissions on a private CA to the Certificate Manager (AC Deletes a private certificate authority (CA)

Revokes permissions on a private CA granted to the Certificate Manager (ACM) Deletes the resource-based policy attached to a private CA

Lists information about your private certificate authority (CA) or one that has be Lists information about a specific audit report created by calling the CreateCerti Retrieves a certificate from your private CA or one that has been shared with yo Retrieves the certificate and certificate chain for your private certificate authority Retrieves the certificate signing request (CSR) for your private certificate author Retrieves the resource-based policy attached to a private CA

Imports a signed private CA certificate into Amazon Web Services Private CA Uses your private certificate authority (CA), or one that has been shared with yo Lists the private certificate authorities that you created by using the CreateCertificate all permissions on a private CA, if any, granted to the Certificate Manager (Lists the tags, if any, that are associated with your private CA or one that has been Attaches a resource-based policy to a private CA

Restores a certificate authority (CA) that is in the DELETED state Revokes a certificate that was issued inside Amazon Web Services Private CA

Adds one or more tags to your private CA Remove one or more tags from your private CA

Updates the status or configuration of a private certificate authority (CA)

Examples

```
## Not run:
svc <- acmpca()
svc$create_certificate_authority(
   Foo = 123
)
## End(Not run)</pre>
```

cleanroomsml 15

cleanroomsml

AWS Clean Rooms ML

Description

Welcome to the Amazon Web Services Clean Rooms ML API Reference.

Amazon Web Services Clean Rooms ML provides a privacy-enhancing method for two parties to identify similar users in their data without the need to share their data with each other. The first party brings the training data to Clean Rooms so that they can create and configure an audience model (lookalike model) and associate it with a collaboration. The second party then brings their seed data to Clean Rooms and generates an audience (lookalike segment) that resembles the training data

To learn more about Amazon Web Services Clean Rooms ML concepts, procedures, and best practices, see the Clean Rooms User Guide.

To learn more about SQL commands, functions, and conditions supported in Clean Rooms, see the Clean Rooms SQL Reference.

Usage

```
cleanroomsml(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret access key: AWS secret access key
 - * session_token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- **endpoint**: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.

16 cleanroomsml

• sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- creds
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cleanroomsml(</pre>
 config = list(
   credentials = list(

clouddirectory

Amazon CloudDirectory

Description

Amazon Cloud Directory

Amazon Cloud Directory is a component of the AWS Directory Service that simplifies the development and management of cloud-scale web, mobile, and IoT applications. This guide describes the Cloud Directory operations that you can call programmatically and includes detailed information on data types and errors. For information about Cloud Directory features, see AWS Directory Service and the Amazon Cloud Directory Developer Guide.

Usage

```
clouddirectory(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- clouddirectory(</pre>
  config = list(
   credentials = list(
     creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
     ),
      profile = "string",
      anonymous = "logical"
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
   s3_force_path_style = "logical",
   sts_regional_endpoint = "string"
 ),
  credentials = list(
   creds = list(
      access_key_id = "string",
      secret_access_key = "string",
     session_token = "string"
   profile = "string",
   anonymous = "logical"
 endpoint = "string",
 region = "string"
)
```

Operations

add_facet_to_object	Adds a new Facet to an object
apply_schema	Copies the input published schema, at the specified version, into the Directory with the sa
attach_object	Attaches an existing object to another object
attach_policy	Attaches a policy object to a regular object
attach_to_index	Attaches the specified object to the specified index
attach_typed_link	Attaches a typed link to a specified source and target object
batch_read	Performs all the read operations in a batch
batch_write	Performs all the write operations in a batch
create_directory	Creates a Directory by copying the published schema into the directory
create_facet	Creates a new Facet in a schema
create_index	Creates an index object
create_object	Creates an object in a Directory
create_schema	Creates a new schema in a development state

delete_object Deletes an object and its associated attributes

delete_schemaDeletes a given schemadelete_typed_link_facetDeletes a TypedLinkFacet

detach_from_index
detach_object

Detaches the specified object from the specified index
Detaches a given object from the parent object

detach_policy Detaches a policy from an object

detach_typed_link Detaches a typed link from a specified source and target object

disable_directory
enable_directory

Disables the specified directory
Enables the specified directory

get_applied_schema_version Returns current applied schema version ARN, including the minor version in use

get_directory Retrieves metadata about a directory

get_facet Gets details of the Facet, such as facet name, attributes, Rules, or ObjectType

get_link_attributes Retrieves attributes that are associated with a typed link

get_object_attributes Retrieves attributes within a facet that are associated with an object

get_object_information Retrieves metadata about an object

get_schema_as_json Retrieves a JSON representation of the schema

get_typed_link_facet_information Returns the identity attribute order for a specific TypedLinkFacet

 list_applied_schema_arns
 Lists schema major versions applied to a directory

 list_attached_indices
 Lists indices attached to the specified object

list_development_schema_arns Retrieves each Amazon Resource Name (ARN) of schemas in the development state

 list_directories
 Lists directories created within an account

 list_facet_attributes
 Retrieves attributes attached to the facet

list_facet_names Retrieves the names of facets that exist in a schema

list_incoming_typed_links

Returns a paginated list of all the incoming TypedLinkSpecifier information for an object

list_index Lists objects attached to the specified index

list_managed_schema_arns
Lists the major version families of each managed schema
list_object_attributes
Lists all attributes that are associated with an object

list_object_children

Returns a paginated list of child objects that are associated with a given object

list_object_parent_paths Retrieves all available parent paths for any object type such as node, leaf node, policy node.

list_object_parents Lists parent objects that are associated with a given object in pagination fashion

list_object_policies Returns policies attached to an object in pagination fashion

list_outgoing_typed_links Returns a paginated list of all the outgoing TypedLinkSpecifier information for an object

list_policy_attachments Returns all of the ObjectIdentifiers to which a given policy is attached

list_published_schema_arns Lists the major version families of each published schema

list_tags_for_resource Returns tags for a resource

list_typed_link_facet_attributes Returns a paginated list of all attribute definitions for a particular TypedLinkFacet

list_typed_link_facet_names

Returns a paginated list of TypedLink facet names for a particular schema

Lists all policies from the root of the Directory to the object specified

lookup_policy
Lists all policies from the root of the Directory to the object specified
publish_schema
Publishes a development schema with a major version and a recommended minor version

put_schema_from_json Allows a schema to be updated using JSON upload remove_facet_from_object Removes the specified facet from the specified object

tag_resource An API operation for adding tags to a resource untag_resource An API operation for removing tags from a resource

update_facet Does the following:

22 cloudhsm

update_object_attributes update_schema update_typed_link_facet upgrade_applied_schema upgrade_published_schema Updates a given object's attributes Updates the schema name with a new name Updates a TypedLinkFacet

Upgrades a single directory in-place using the PublishedSchemaArn with schema update. Upgrades a published schema under a new minor version revision using the current conte

Examples

```
## Not run:
svc <- clouddirectory()
svc$add_facet_to_object(
  Foo = 123
)
## End(Not run)</pre>
```

cloudhsm

Amazon CloudHSM

Description

AWS CloudHSM Service

This is documentation for AWS CloudHSM Classic. For more information, see AWS CloudHSM Classic FAQs, the AWS CloudHSM Classic User Guide, and the AWS CloudHSM Classic API Reference.

For information about the current version of AWS CloudHSM, see AWS CloudHSM, the AWS CloudHSM User Guide, and the AWS CloudHSM API Reference.

Usage

```
cloudhsm(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * **session_token**: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.

cloudhsm 23

- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- **close_connection**: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Option

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cloudhsm(</pre>
 config = list(
   credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
   ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
   sts_regional_endpoint = "string"
```

24 cloudhsm

```
),
  credentials = list(
    creds = list(
    access_key_id = "string",
    secret_access_key = "string",
    session_token = "string"
  ),
  profile = "string",
  anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

Operations

cloudhsmv2 25

cloudhsmv2

AWS CloudHSM V2

Description

For more information about CloudHSM, see CloudHSM and the CloudHSM User Guide.

Usage

```
cloudhsmv2(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.

26 cloudhsmv2

• anonymous: Set anonymous credentials.

endpoint Optional shorthand for complete URL to use for the constructed client.

region Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cloudhsmv2(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
   profile = "string",
    anonymous = "logical"
 endpoint = "string",
  region = "string"
)
```

Operations

copy_backup_to_regionCopy an CloudHSM cluster backup to a different regioncreate_clusterCreates a new CloudHSM clustercreate_hsmCreates a new hardware security module (HSM) in the specified CloudHSM cluster

cognitoidentity 27

delete_backup

delete_cluster

Deletes a specified CloudHSM backup

Deletes the specified CloudHSM cluster

delete_hsm Deletes the specified HSM

delete_resource_policy Deletes an CloudHSM resource policy

describe_backups Gets information about backups of CloudHSM clusters

describe_clusters Gets information about CloudHSM clusters

get_resource_policy Retrieves the resource policy document attached to a given resource

initialize_cluster

Claims an CloudHSM cluster by submitting the cluster certificate issued by your issuing certificate.

list_tags Gets a list of tags for the specified CloudHSM cluster

modify_cluster Modifies CloudHSM cluster

put_resource_policy
Creates or updates an CloudHSM resource policy

restore_backup Restores a specified CloudHSM backup that is in the PENDING_DELETION state

tag_resource Adds or overwrites one or more tags for the specified CloudHSM cluster untag_resource Removes the specified tag or tags from the specified CloudHSM cluster

Examples

```
## Not run:
svc <- cloudhsmv2()
svc$copy_backup_to_region(
   Foo = 123
)
## End(Not run)</pre>
```

cognitoidentity

Amazon Cognito Identity

Description

Amazon Cognito Federated Identities

Amazon Cognito Federated Identities is a web service that delivers scoped temporary credentials to mobile devices and other untrusted environments. It uniquely identifies a device and supplies the user with a consistent identity over the lifetime of an application.

Using Amazon Cognito Federated Identities, you can enable authentication with one or more third-party identity providers (Facebook, Google, or Login with Amazon) or an Amazon Cognito user pool, and you can also choose to support unauthenticated access from your app. Cognito delivers a unique identifier for each user and acts as an OpenID token provider trusted by AWS Security Token Service (STS) to access temporary, limited-privilege AWS credentials.

For a description of the authentication flow from the Amazon Cognito Developer Guide see Authentication Flow.

For more information see Amazon Cognito Federated Identities.

28 cognitoidentity

Usage

```
cognitoidentity(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

cognitoidentity 29

Service syntax

cognitoidentityprovider

Amazon Cognito Identity Provider

Description

With the Amazon Cognito user pools API, you can configure user pools and authenticate users. To authenticate users from third-party identity providers (IdPs) in this API, you can link IdP users to native user profiles. Learn more about the authentication and authorization of federated users at Adding user pool sign-in through a third party and in the User pool federation endpoints and hosted UI reference.

Updates an identity pool

This API reference provides detailed information about API operations and object types in Amazon Cognito.

Along with resource management operations, the Amazon Cognito user pools API includes classes of operations and authorization models for client-side and server-side authentication of users. You can interact with operations in the Amazon Cognito user pools API as any of the following subjects.

- 1. An administrator who wants to configure user pools, app clients, users, groups, or other user pool functions.
- 2. A server-side app, like a web application, that wants to use its Amazon Web Services privileges to manage, authenticate, or authorize a user.
- 3. A client-side app, like a mobile app, that wants to make unauthenticated requests to manage, authenticate, or authorize a user.

For more information, see Using the Amazon Cognito user pools API and user pool endpoints in the Amazon Cognito Developer Guide.

With your Amazon Web Services SDK, you can build the logic to support operational flows in every use case for this API. You can also make direct REST API requests to Amazon Cognito user pools service endpoints. The following links can get you started with the CognitoIdentityProvider client in other supported Amazon Web Services SDKs.

- Amazon Web Services Command Line Interface
- Amazon Web Services SDK for .NET
- Amazon Web Services SDK for C++
- · Amazon Web Services SDK for Go
- Amazon Web Services SDK for Java V2
- Amazon Web Services SDK for JavaScript
- Amazon Web Services SDK for PHP V3
- Amazon Web Services SDK for Python
- Amazon Web Services SDK for Ruby V3
- · Amazon Web Services SDK for Kotlin

To get started with an Amazon Web Services SDK, see Tools to Build on Amazon Web Services. For example actions and scenarios, see Code examples for Amazon Cognito Identity Provider using Amazon Web Services SDKs.

Usage

```
cognitoidentityprovider(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.

- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cognitoidentityprovider(</pre>
 config = list(

Adds additional user attributes to the user pool schema

Adds a user to a group

Confirms user sign-up as an administrator Creates a new user in the specified user pool Deletes a user profile in your user pool Deletes attribute values from a user

Prevents the user from signing in with the specified external (SAML or social

Deactivates a user profile and revokes all access tokens for the user

Activate sign-in for a user profile that previously had sign-in access disabled

Forgets, or deletes, a remembered device from a user's profile

Given the device key, returns details for a user' device

Given the username, returns details about a user profile in a user pool

Starts sign-in for applications with a server-side component, for example a tra Links an existing user account in a user pool (DestinationUser) to an identity

Lists a user's registered devices

Lists the groups that a user belongs to

Requests a history of user activity and any risks detected as part of Amazon C

Given a username and a group name

Resets the specified user's password in a user pool

Some API operations in a user pool generate a challenge, like a prompt for an Sets the user's multi-factor authentication (MFA) preference, including which

Sets the specified user's password in a user pool

This action is no longer supported

Provides feedback for an authentication event indicating if it was from a valid Updates the status of a user's device so that it is marked as remembered or no

This action might generate an SMS text message

Invalidates the identity, access, and refresh tokens that Amazon Cognito issue Begins setup of time-based one-time password (TOTP) multi-factor authentic

Changes the password for a specified user in a user pool

Completes registration of a passkey authenticator for the current user

Confirms a device that a user wants to remember

This public API operation accepts a confirmation code that Amazon Cognito

This public API operation submits a code that Amazon Cognito sent to your u

Creates a new group in the specified user pool

Adds a configuration and trust relationship between a third-party identity prov Creates a new set of branding settings for a user pool style and associates it w

Creates a new OAuth2 create_resource_server Creates a user import job create_user_import_job

This action might generate an SMS text message create_user_pool

Creates an app client in a user pool create_user_pool_client

create_user_pool_domain A user pool domain hosts managed login, an authorization server and web ser

delete_group

Deletes a group from the specified user pool delete_identity_provider Deletes a user pool identity provider (IdP) Deletes a managed login branding style delete_managed_login_branding

delete_resource_server Deletes a resource server delete_user Self-deletes a user profile delete_user_attributes Self-deletes attributes for a user

delete_user_pool Deletes a user pool

Deletes a user pool app client delete_user_pool_client

delete_user_pool_domain Given a user pool ID and domain identifier, deletes a user pool domain

Deletes a registered passkey, or webauthN, authenticator for the currently sign delete_web_authn_credential describe_identity_provider Given a user pool ID and identity provider (IdP) name, returns details about the describe_managed_login_branding Given the ID of a managed login branding style, returns detailed information

describe_managed_login_branding_by_client Given the ID of a user pool app client, returns detailed information about the describe_resource_server Describes a resource server

describe_risk_configuration Given an app client or user pool ID where threat protection is configured, des describe_user_import_job Describes a user import job

describe_user_pool Given a user pool ID, returns configuration information describe_user_pool_client Given an app client ID, returns configuration information

describe_user_pool_domain Given a user pool domain name, returns information about the domain config

forget_device Forgets the specified device

forgot_password Calling this API causes a message to be sent to the end user with a confirmati get_csv_header Gets the header information for the comma-separated value (CSV) file to be u

get_device Gets the device Gets a group get_group get_identity_provider_by_identifier Gets the specified IdP

get_log_delivery_configuration Gets the logging configuration of a user pool

get_signing_certificate This method takes a user pool ID, and returns the signing certificate

Gets the user interface (UI) Customization information for a particular app cli get_ui_customization

Gets the user attributes and metadata for a user get_user

get_user_attribute_verification_code Generates a user attribute verification code for the specified attribute name

get_user_auth_factors Lists the authentication options for the currently signed-in user get_user_pool_mfa_config Gets the user pool multi-factor authentication (MFA) configuration

global_sign_out Invalidates the identity, access, and refresh tokens that Amazon Cognito issue

initiate_auth Initiates sign-in for a user in the Amazon Cognito user directory

list_devices Lists the sign-in devices that Amazon Cognito has registered to the current us

list_groups Lists the groups associated with a user pool Lists information about all IdPs for a user pool list_identity_providers list_resource_servers Lists the resource servers for a user pool

Lists the tags that are assigned to an Amazon Cognito user pool list_tags_for_resource

list_user_import_jobs Lists user import jobs for a user pool

list_user_pool_clients Lists the clients that have been created for the specified user pool Lists the user pools associated with an Amazon Web Services account list_user_pools

Lists users and their basic details in a user pool list_users

cognitosync 35

list_users_in_group list_web_authn_credentials resend_confirmation_code respond_to_auth_challenge revoke_token set_log_delivery_configuration set_risk_configuration set_ui_customization set_user_mfa_preference set_user_pool_mfa_config set_user_settings sign_up start_user_import_job start_web_authn_registration stop_user_import_job tag_resource untag_resource update_auth_event_feedback update_device_status update_group update_identity_provider update_managed_login_branding update_resource_server update_user_attributes update_user_pool update_user_pool_client update_user_pool_domain verify_software_token verify_user_attribute

Lists the users in the specified group

Generates a list of the current user's registered passkey, or webauthN, credent Resends the confirmation (for confirmation of registration) to a specific user i Some API operations in a user pool generate a challenge, like a prompt for an Revokes all of the access tokens generated by, and at the same time as, the spects up or modifies the logging configuration of a user pool

Configures actions on detected risks

Sets the user interface (UI) customization information for a user pool's built-is Set the user's multi-factor authentication (MFA) method preference, including Sets the user pool multi-factor authentication (MFA) and passkey configuration This action is no longer supported

Registers the user in the specified user pool and creates a user name, password Starts the user import

Requests credential creation options from your user pool for registration of a Stops the user import job

Assigns a set of tags to an Amazon Cognito user pool

Removes the specified tags from an Amazon Cognito user pool

Provides the feedback for an authentication event, whether it was from a valid Updates the device status

Updates the specified group with the specified attributes

Updates IdP information for a user pool

Configures the branding settings for a user pool style

Updates the name and scopes of resource server

With this operation, your users can update one or more of their attributes with

This action might generate an SMS text message

Updates the specified user pool app client with the specified attributes

A user pool domain hosts managed login, an authorization server and web ser Use this API to register a user's entered time-based one-time password (TOTI

Verifies the specified user attributes in the user pool

Examples

```
## Not run:
svc <- cognitoidentityprovider()
svc$add_custom_attributes(
   Foo = 123
)
## End(Not run)</pre>
```

36 cognitosync

Description

Amazon Cognito Sync provides an AWS service and client library that enable cross-device syncing of application-related user data. High-level client libraries are available for both iOS and Android. You can use these libraries to persist data locally so that it's available even if the device is offline. Developer credentials don't need to be stored on the mobile device to access the service. You can use Amazon Cognito to obtain a normalized user ID and credentials. User data is persisted in a dataset that can store up to 1 MB of key-value pairs, and you can have up to 20 datasets per user identity.

With Amazon Cognito Sync, the data stored for each identity is accessible only to credentials assigned to that identity. In order to use the Cognito Sync service, you need to make API calls using credentials retrieved with Amazon Cognito Identity service.

If you want to use Cognito Sync in an Android or iOS application, you will probably want to make API calls via the AWS Mobile SDK. To learn more, see the Developer Guide for Android and the Developer Guide for iOS.

Usage

```
cognitosync(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

cognitosync 37

credentials Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- cognitosync(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  endpoint = "string",
```

```
region = "string"
)
```

Operations

bulk_publish delete_dataset describe dataset describe_identity_pool_usage describe_identity_usage get_bulk_publish_details get cognito events get_identity_pool_configuration list datasets list_identity_pool_usage list_records register_device set_cognito_events set_identity_pool_configuration subscribe_to_dataset unsubscribe_from_dataset update_records

Initiates a bulk publish of all existing datasets for an Identity Pool to the configured stream Deletes the specific dataset

Gets meta data about a dataset by identity and dataset name

Gets usage details (for example, data storage) about a particular identity pool Gets usage information for an identity, including number of datasets and data usage

Get the status of the last BulkPublish operation for an identity pool

Gets the events and the corresponding Lambda functions associated with an identity pool

Gets the configuration settings of an identity pool

Lists datasets for an identity

Gets a list of identity pools registered with Cognito

Gets paginated records, optionally changed after a particular sync count for a dataset and ic

Registers a device to receive push sync notifications

Sets the AWS Lambda function for a given event type for an identity pool

Sets the necessary configuration for push sync

Subscribes to receive notifications when a dataset is modified by another device Unsubscribes from receiving notifications when a dataset is modified by another device

Posts updates to records and adds and deletes records for a dataset and user

Examples

```
## Not run:
svc <- cognitosync()
svc$bulk_publish(
   Foo = 123
)
## End(Not run)</pre>
```

detective

Amazon Detective

Description

Detective uses machine learning and purpose-built visualizations to help you to analyze and investigate security issues across your Amazon Web Services (Amazon Web Services) workloads. Detective automatically extracts time-based events such as login attempts, API calls, and network traffic from CloudTrail and Amazon Virtual Private Cloud (Amazon VPC) flow logs. It also extracts findings detected by Amazon GuardDuty.

The Detective API primarily supports the creation and management of behavior graphs. A behavior graph contains the extracted data from a set of member accounts, and is created and managed by an administrator account.

To add a member account to the behavior graph, the administrator account sends an invitation to the account. When the account accepts the invitation, it becomes a member account in the behavior graph.

Detective is also integrated with Organizations. The organization management account designates the Detective administrator account for the organization. That account becomes the administrator account for the organization behavior graph. The Detective administrator account is also the delegated administrator account for Detective in Organizations.

The Detective administrator account can enable any organization account as a member account in the organization behavior graph. The organization accounts do not receive invitations. The Detective administrator account can also invite other accounts to the organization behavior graph.

Every behavior graph is specific to a Region. You can only use the API to manage behavior graphs that belong to the Region that is associated with the currently selected endpoint.

The administrator account for a behavior graph can use the Detective API to do the following:

- Enable and disable Detective. Enabling Detective creates a new behavior graph.
- View the list of member accounts in a behavior graph.
- · Add member accounts to a behavior graph.
- Remove member accounts from a behavior graph.
- Apply tags to a behavior graph.

The organization management account can use the Detective API to select the delegated administrator for Detective.

The Detective administrator account for an organization can use the Detective API to do the following:

- Perform all of the functions of an administrator account.
- Determine whether to automatically enable new organization accounts as member accounts in the organization behavior graph.

An invited member account can use the Detective API to do the following:

- View the list of behavior graphs that they are invited to.
- Accept an invitation to contribute to a behavior graph.
- Decline an invitation to contribute to a behavior graph.
- Remove their account from a behavior graph.

All API actions are logged as CloudTrail events. See Logging Detective API Calls with CloudTrail.

We replaced the term "master account" with the term "administrator account". An administrator account is used to centrally manage multiple accounts. In the case of Detective, the administrator account manages the accounts in their behavior graph.

Usage

```
detective(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- detective(</pre>
 config = list(
   credentials = list(

)
## End(Not run)</pre>
```

directoryservice

AWS Directory Service

Description

Directory Service

Directory Service is a web service that makes it easy for you to setup and run directories in the Amazon Web Services cloud, or connect your Amazon Web Services resources with an existing self-managed Microsoft Active Directory. This guide provides detailed information about Directory Service operations, data types, parameters, and errors. For information about Directory Services features, see Directory Service and the Directory Service Administration Guide.

Amazon Web Services provides SDKs that consist of libraries and sample code for various programming languages and platforms (Java, Ruby, .Net, iOS, Android, etc.). The SDKs provide a convenient way to create programmatic access to Directory Service and other Amazon Web Services services. For more information about the Amazon Web Services SDKs, including how to download and install them, see Tools for Amazon Web Services.

Usage

```
directoryservice(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - **anonymous**: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- directoryservice(</pre>
 config = list(
   credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
   ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
   sts_regional_endpoint = "string"
 ),
  credentials = list(
   creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
   ),
   profile = "string",
   anonymous = "logical"
 endpoint = "string",
  region = "string"
)
```

fms

Firewall Management Service

Description

This is the *Firewall Manager API Reference*. This guide is for developers who need detailed information about the Firewall Manager API actions, data types, and errors. For detailed information about Firewall Manager features, see the Firewall Manager Developer Guide.

Some API actions require explicit resource permissions. For information, see the developer guide topic Service roles for Firewall Manager.

Usage

```
fms(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token

fms 47

- profile: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.
- **endpoint**: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- fms(
  config = list(
    credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",

guardduty

Amazon GuardDuty

Description

Amazon GuardDuty is a continuous security monitoring service that analyzes and processes the following foundational data sources - VPC flow logs, Amazon Web Services CloudTrail management event logs, CloudTrail S3 data event logs, EKS audit logs, DNS logs, Amazon EBS volume data, runtime activity belonging to container workloads, such as Amazon EKS, Amazon ECS (including Amazon Web Services Fargate), and Amazon EC2 instances. It uses threat intelligence feeds, such as lists of malicious IPs and domains, and machine learning to identify unexpected, potentially unauthorized, and malicious activity within your Amazon Web Services environment. This can include issues like escalations of privileges, uses of exposed credentials, or communication with malicious IPs, domains, or presence of malware on your Amazon EC2 instances and container workloads. For example, GuardDuty can detect compromised EC2 instances and container workloads serving malware, or mining bitcoin.

GuardDuty also monitors Amazon Web Services account access behavior for signs of compromise, such as unauthorized infrastructure deployments like EC2 instances deployed in a Region that has never been used, or unusual API calls like a password policy change to reduce password strength.

GuardDuty informs you about the status of your Amazon Web Services environment by producing security findings that you can view in the GuardDuty console or through Amazon EventBridge. For more information, see the *Amazon GuardDuty User Guide*.

Usage

```
guardduty(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- guardduty(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",

iam

AWS Identity and Access Management

Description

Identity and Access Management

Identity and Access Management (IAM) is a web service for securely controlling access to Amazon Web Services services. With IAM, you can centrally manage users, security credentials such as access keys, and permissions that control which Amazon Web Services resources users and applications can access. For more information about IAM, see Identity and Access Management (IAM) and the Identity and Access Management User Guide.

Usage

```
iam(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile
 is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- iam(
  config = list(
    credentials = list(
    creds = list(
    access_key_id = "string",</pre>
```

```
secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string";
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  endpoint = "string",
  region = "string"
)
```

Operations

```
add_client_id_to_open_id_connect_provider
add_role_to_instance_profile
add_user_to_group
attach_group_policy
attach_role_policy
attach_user_policy
change_password
create_access_key
create_account_alias
create group
create_instance_profile

iamrolesanywhere

IAM Roles Anywhere

Description

Identity and Access Management Roles Anywhere provides a secure way for your workloads such as servers, containers, and applications that run outside of Amazon Web Services to obtain temporary Amazon Web Services credentials. Your workloads can use the same IAM policies and roles you have for native Amazon Web Services applications to access Amazon Web Services resources. Using IAM Roles Anywhere eliminates the need to manage long-term credentials for workloads running outside of Amazon Web Services.

To use IAM Roles Anywhere, your workloads must use X.509 certificates issued by their certificate authority (CA). You register the CA with IAM Roles Anywhere as a trust anchor to establish trust between your public key infrastructure (PKI) and IAM Roles Anywhere. If you don't manage your own PKI system, you can use Private Certificate Authority to create a CA and then use that to establish trust with IAM Roles Anywhere.

This guide describes the IAM Roles Anywhere operations that you can call programmatically. For more information about IAM Roles Anywhere, see the IAM Roles Anywhere User Guide.

Usage

```
iamrolesanywhere(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

60 iamrolesanywhere

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile
 is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- iamrolesanywhere(
  config = list(
    credentials = list(
    creds = list(
    access_key_id = "string",</pre>
```

iamrolesanywhere 61

```
secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  endpoint = "string",
  region = "string"
)
```

Operations

list_profiles

list_subjects

create_profile Creates a profile, a list of the roles that Roles Anywhere service is trusted to assume Creates a trust anchor to establish trust between IAM Roles Anywhere and your certificate author create_trust_anchor delete_attribute_mapping Delete an entry from the attribute mapping rules enforced by a given profile delete_crl Deletes a certificate revocation list (CRL) Deletes a profile delete_profile delete_trust_anchor Deletes a trust anchor disable_crl Disables a certificate revocation list (CRL) disable_profile Disables a profile disable_trust_anchor Disables a trust anchor Enables a certificate revocation list (CRL) enable crl enable_profile Enables temporary credential requests for a profile enable_trust_anchor Enables a trust anchor get_crl Gets a certificate revocation list (CRL) get_profile Gets a profile get_subject Gets a subject, which associates a certificate identity with authentication attempts get_trust_anchor Gets a trust anchor Imports the certificate revocation list (CRL) import_crl list_crls Lists all certificate revocation lists (CRL) in the authenticated account and Amazon Web Services

Lists all profiles in the authenticated account and Amazon Web Services Region

Lists the subjects in the authenticated account and Amazon Web Services Region

62 identitystore

list_tags_for_resource list_trust_anchors put_attribute_mapping put_notification_settings reset_notification_settings tag_resource untag_resource update_crl update_profile

update_trust_anchor

Lists the tags attached to the resource

Lists the trust anchors in the authenticated account and Amazon Web Services Region Put an entry in the attribute mapping rules that will be enforced by a given profile

Attaches a list of notification settings to a trust anchor

Resets the custom notification setting to IAM Roles Anywhere default setting

Attaches tags to a resource Removes tags from the resource

ate_crl Updates the certificate revocation list (CRL)

Updates a profile, a list of the roles that IAM Roles Anywhere service is trusted to assume

Updates a trust anchor

Examples

```
## Not run:
svc <- iamrolesanywhere()
svc$create_profile(
   Foo = 123
)
## End(Not run)</pre>
```

identitystore

AWS SSO Identity Store

Description

The Identity Store service used by IAM Identity Center provides a single place to retrieve all of your identities (users and groups). For more information, see the IAM Identity Center User Guide.

This reference guide describes the identity store operations that you can call programmatically and includes detailed information about data types and errors.

IAM Identity Center uses the sso and identitystore API namespaces.

Usage

```
identitystore(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

identitystore 63

Arguments

config Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile
 is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- identitystore(
  config = list(
    credentials = list(
    creds = list(
    access_key_id = "string",</pre>
```

64 identitystore

```
secret_access_key = "string",
        session_token = "string"
     ),
     profile = "string",
     anonymous = "logical"
   ),
   endpoint = "string",
   region = "string",
    close_connection = "logical",
    timeout = "numeric",
   s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
   creds = list(
     access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
   ),
   profile = "string",
   anonymous = "logical"
  endpoint = "string",
  region = "string"
)
```

Operations

create_group create_group_membership create user delete_group delete_group_membership delete_user describe_group describe_group_membership describe_user get_group_id $get_group_membership_id$ get_user_id is_member_in_groups list_group_memberships list_group_memberships_for_member list_groups list_users update_group update_user

Creates a group within the specified identity store Creates a relationship between a member and a group Creates a user within the specified identity store Delete a group within an identity store given GroupId Delete a membership within a group given MembershipId Deletes a user within an identity store given UserId

Retrieves the group metadata and attributes from GroupId in an identity store Retrieves membership metadata and attributes from MembershipId in an identity store

Retrieves the user metadata and attributes from the UserId in an identity store

Retrieves GroupId in an identity store

Retrieves the MembershipId in an identity store

Retrieves the UserId in an identity store

Checks the user's membership in all requested groups and returns if the member exis For the specified group in the specified identity store, returns the list of all GroupMer For the specified member in the specified identity store, returns the list of all GroupM

Lists all groups in the identity store Lists all users in the identity store

For the specified group in the specified identity store, updates the group metadata and For the specified user in the specified identity store, updates the user metadata and at

Examples

```
## Not run:
svc <- identitystore()
svc$create_group(
   Foo = 123
)
## End(Not run)</pre>
```

inspector

Amazon Inspector

Description

Amazon Inspector enables you to analyze the behavior of your AWS resources and to identify potential security issues. For more information, see Amazon Inspector User Guide.

Usage

```
inspector(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.

- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- inspector(</pre>
 config = list(
   credentials = list(
     creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
     ),
     profile = "string",
     anonymous = "logical"
   ),
   endpoint = "string",
   region = "string",
   close_connection = "logical",
    timeout = "numeric",
   s3_force_path_style = "logical",
   sts_regional_endpoint = "string"
  ),
  credentials = list(
   creds = list(
     access_key_id = "string",
     secret_access_key = "string",
     session_token = "string"
```

```
),
   profile = "string",
   anonymous = "logical"
),

  )
)
## End(Not run)
```

inspector2

Inspector2

Description

Amazon Inspector is a vulnerability discovery service that automates continuous scanning for security vulnerabilities within your Amazon EC2, Amazon ECR, and Amazon Web Services Lambda environments.

Usage

```
inspector2(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key

- * session_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- inspector2(
  config = list(
    credentials = list(
      creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
    ),
  endpoint = "string",
  region = "string",</pre>
```

```
close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
   creds = list(
     access_key_id = "string",
     secret_access_key = "string",
     session_token = "string"
   ),
   profile = "string",
   anonymous = "logical"
 endpoint = "string",

AWS Key Management Service

kms

Description

Key Management Service

Key Management Service (KMS) is an encryption and key management web service. This guide describes the KMS operations that you can call programmatically. For general information about KMS, see the *Key Management Service Developer Guide*.

KMS has replaced the term *customer master key (CMK)* with *KMS key* and *KMS key*. The concept has not changed. To prevent breaking changes, KMS is keeping some variations of this term.

Amazon Web Services provides SDKs that consist of libraries and sample code for various programming languages and platforms (Java, Ruby, .Net, macOS, Android, etc.). The SDKs provide a convenient way to create programmatic access to KMS and other Amazon Web Services services. For example, the SDKs take care of tasks such as signing requests (see below), managing errors, and retrying requests automatically. For more information about the Amazon Web Services SDKs, including how to download and install them, see Tools for Amazon Web Services.

We recommend that you use the Amazon Web Services SDKs to make programmatic API calls to KMS.

If you need to use FIPS 140-2 validated cryptographic modules when communicating with Amazon Web Services, use the FIPS endpoint in your preferred Amazon Web Services Region. For more information about the available FIPS endpoints, see Service endpoints in the Key Management Service topic of the *Amazon Web Services General Reference*.

All KMS API calls must be signed and be transmitted using Transport Layer Security (TLS). KMS recommends you always use the latest supported TLS version. Clients must also support cipher suites with Perfect Forward Secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Signing Requests

Requests must be signed using an access key ID and a secret access key. We strongly recommend that you do not use your Amazon Web Services account root access key ID and secret access key for everyday work. You can use the access key ID and secret access key for an IAM user or you can use the Security Token Service (STS) to generate temporary security credentials and use those to sign requests.

All KMS requests must be signed with Signature Version 4.

Logging API Requests

KMS supports CloudTrail, a service that logs Amazon Web Services API calls and related events for your Amazon Web Services account and delivers them to an Amazon S3 bucket that you specify. By using the information collected by CloudTrail, you can determine what requests were made to KMS, who made the request, when it was made, and so on. To learn more about CloudTrail, including how to turn it on and find your log files, see the CloudTrail User Guide.

Additional Resources

For more information about credentials and request signing, see the following:

kms 73

 Amazon Web Services Security Credentials - This topic provides general information about the types of credentials used to access Amazon Web Services.

- Temporary Security Credentials This section of the *IAM User Guide* describes how to create and use temporary security credentials.
- Signature Version 4 Signing Process This set of topics walks you through the process of signing a request using an access key ID and a secret access key.

Commonly Used API Operations

Of the API operations discussed in this guide, the following will prove the most useful for most applications. You will likely perform operations other than these, such as creating keys and assigning policies, by using the console.

- encrypt
- decrypt
- generate_data_key
- generate_data_key_without_plaintext

Usage

```
kms(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- **sts_regional_endpoint**: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID

74 kms

- secret_access_key: AWS secret access key
- session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

```
svc <- kms(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string";
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    profile = "string",
    anonymous = "logical"
 endpoint = "string",
  region = "string"
)
```

Operations

cancel_key_deletion Cancels the deletion of a KMS key

connect_custom_key_store Connects or reconnects a custom key store to its backing key store

Creates a friendly name for a KMS key create_alias

Creates a custom key store backed by a key store that you own and manage create_custom_key_store

Adds a grant to a KMS key create_grant

Creates a unique customer managed KMS key in your Amazon Web Services ac create_key decrypt Decrypts ciphertext that was encrypted by a KMS key using any of the following

delete_alias Deletes the specified alias Deletes a custom key store delete_custom_key_store

delete_imported_key_material Deletes key material that was previously imported Derives a shared secret using a key agreement algorithm derive_shared_secret

describe_custom_key_stores Gets information about custom key stores in the account and Region

describe_key Provides detailed information about a KMS key disable_key Sets the state of a KMS key to disabled

disable_key_rotation Disables automatic rotation of the key material of the specified symmetric encry

disconnect_custom_key_store Disconnects the custom key store from its backing key store

enable_key Sets the key state of a KMS key to enabled

enable_key_rotation Enables automatic rotation of the key material of the specified symmetric encryp

Encrypts plaintext of up to 4,096 bytes using a KMS key encrypt Returns a unique symmetric data key for use outside of KMS generate_data_key Returns a unique asymmetric data key pair for use outside of KMS generate_data_key_pair generate_data_key_pair_without_plaintext Returns a unique asymmetric data key pair for use outside of KMS

generate_data_key_without_plaintext Returns a unique symmetric data key for use outside of KMS

Generates a hash-based message authentication code (HMAC) for a message usi generate_mac generate_random Returns a random byte string that is cryptographically secure

Gets a key policy attached to the specified KMS key get_key_policy get_key_rotation_status Provides detailed information about the rotation status for a KMS key, including

get_parameters_for_import get_public_key Returns the public key of an asymmetric KMS key

Imports or reimports key material into an existing KMS key that was created wit import_key_material list_aliases Gets a list of aliases in the caller's Amazon Web Services account and region

Returns the public key and an import token you need to import or reimport key n

Gets a list of all grants for the specified KMS key list_grants

Gets the names of the key policies that are attached to a KMS key list_key_policies

list_key_rotations Returns information about all completed key material rotations for the specified

Gets a list of all KMS keys in the caller's Amazon Web Services account and Re list_keys

list_resource_tags Returns all tags on the specified KMS key Returns information about all grants in the Amazon Web Services account and R

list_retirable_grants Attaches a key policy to the specified KMS key put_key_policy

re_encrypt Decrypts ciphertext and then reencrypts it entirely within KMS Replicates a multi-Region key into the specified Region replicate_key

retire_grant Deletes a grant

tag_resource

revoke_grant Deletes the specified grant

rotate_key_on_demand Immediately initiates rotation of the key material of the specified symmetric encountries

schedule_key_deletion Schedules the deletion of a KMS key

Creates a digital signature for a message or message digest by using the private k sign

Adds or edits tags on a customer managed key

76 macie2

```
untag_resource
update_alias
update_custom_key_store
update_key_description
update_primary_region
verify
verify_mac
```

Deletes tags from a customer managed key
Associates an existing KMS alias with a different KMS key
Changes the properties of a custom key store
Updates the description of a KMS key
Changes the primary key of a multi-Region key
Verifies a digital signature that was generated by the Sign operation
Verifies the hash-based message authentication code (HMAC) for a specified me

Examples

```
## Not run:
svc <- kms()
# The following example cancels deletion of the specified KMS key.
svc$cancel_key_deletion(
   KeyId = "1234abcd-12ab-34cd-56ef-1234567890ab"
)
## End(Not run)</pre>
```

macie2

Amazon Macie 2

Description

Amazon Macie

Usage

```
macie2(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.

macie2 77

- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

```
svc <- macie2(</pre>
 config = list(
   credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
   ),
    endpoint = "string",
    region = "string",
   close_connection = "logical",
    timeout = "numeric",
   s3_force_path_style = "logical",
   sts_regional_endpoint = "string"

pcaconnectorad

PcaConnectorAd

Description

Amazon Web Services Private CA Connector for Active Directory creates a connector between Amazon Web Services Private CA and Active Directory (AD) that enables you to provision security certificates for AD signed by a private CA that you own. For more information, see Amazon Web Services Private CA Connector for Active Directory.

Usage

```
pcaconnectorad(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.

pcaconnectorad 81

- timeout: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

ram

AWS Resource Access Manager

Description

This is the *Resource Access Manager API Reference*. This documentation provides descriptions and syntax for each of the actions and data types in RAM. RAM is a service that helps you securely share your Amazon Web Services resources to other Amazon Web Services accounts. If you use Organizations to manage your accounts, then you can share your resources with your entire organization or to organizational units (OUs). For supported resource types, you can also share resources with individual Identity and Access Management (IAM) roles and users.

To learn more about RAM, see the following resources:

- Resource Access Manager product page
- Resource Access Manager User Guide

Usage

```
ram(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

86 secretsmanager

secretsmanager

AWS Secrets Manager

Description

Amazon Web Services Secrets Manager

Amazon Web Services Secrets Manager provides a service to enable you to store, manage, and retrieve, secrets.

This guide provides descriptions of the Secrets Manager API. For more information about using this service, see the Amazon Web Services Secrets Manager User Guide.

API Version

This version of the Secrets Manager API Reference documents the Secrets Manager API version 2017-10-17.

For a list of endpoints, see Amazon Web Services Secrets Manager endpoints.

Support and Feedback for Amazon Web Services Secrets Manager

We welcome your feedback. Send your comments to awssecretsmanager-feedback@amazon.com, or post your feedback and questions in the Amazon Web Services Secrets Manager Discussion Forum. For more information about the Amazon Web Services Discussion Forums, see Forums Help.

Logging API Requests

Amazon Web Services Secrets Manager supports Amazon Web Services CloudTrail, a service that records Amazon Web Services API calls for your Amazon Web Services account and delivers log files to an Amazon S3 bucket. By using information that's collected by Amazon Web Services CloudTrail, you can determine the requests successfully made to Secrets Manager, who made the request, when it was made, and so on. For more about Amazon Web Services Secrets Manager and support for Amazon Web Services CloudTrail, see Logging Amazon Web Services Secrets Manager Events with Amazon Web Services CloudTrail in the Amazon Web Services Secrets Manager User Guide. To learn more about CloudTrail, including enabling it and find your log files, see the Amazon Web Services CloudTrail User Guide.

Usage

```
secretsmanager(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:

secretsmanager 87

- * access_key_id: AWS access key ID
- * secret_access_key: AWS secret access key
- * session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

```
svc <- secretsmanager(
  config = list(
    credentials = list(
    creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"</pre>
```

88 secretsmanager

```
),
 endpoint = "string",
  region = "string",
  close_connection = "logical",
  timeout = "numeric",
  s3_force_path_style = "logical",
 sts_regional_endpoint = "string"
credentials = list(
 creds = list(
   access_key_id = "string",
   secret_access_key = "string",
   session_token = "string"
 ),
 profile = "string",
 anonymous = "logical"
endpoint = "string",
region = "string"
```

Operations

batch_get_secret_value cancel_rotate_secret create_secret delete_resource_policy delete_secret describe_secret get_random_password get_resource_policy get_secret_value list_secrets list_secret_version_ids put_resource_policy put_secret_value remove_regions_from_replication replicate_secret_to_regions restore_secret rotate_secret stop_replication_to_replica tag_resource untag_resource update_secret update_secret_version_stage validate_resource_policy

Retrieves the contents of the encrypted fields SecretString or SecretBinary for up to 20 se Turns off automatic rotation, and if a rotation is currently in progress, cancels the rotation Creates a new secret

Deletes the resource-based permission policy attached to the secret

Deletes a secret and all of its versions

Retrieves the details of a secret

Generates a random password

Retrieves the JSON text of the resource-based policy document attached to the secret Retrieves the contents of the encrypted fields SecretString or SecretBinary from the speci Lists the secrets that are stored by Secrets Manager in the Amazon Web Services account Lists the versions of a secret

Attaches a resource-based permission policy to a secret

Creates a new version with a new encrypted secret value and attaches it to the secret For a secret that is replicated to other Regions, deletes the secret replicas from the Region Replicates the secret to a new Regions

Cancels the scheduled deletion of a secret by removing the DeletedDate time stamp

Configures and starts the asynchronous process of rotating the secret

Removes the link between the replica secret and the primary secret and promotes the repl

Attaches tags to a secret

Removes specific tags from a secret

Modifies the details of a secret, including metadata and the secret value

Modifies the staging labels attached to a version of a secret

Validates that a resource policy does not grant a wide range of principals access to your s

Examples

```
## Not run:
svc <- secretsmanager()
# The following example shows how to cancel rotation for a secret. The
# operation sets the RotationEnabled field to false and cancels all
# scheduled rotations. To resume scheduled rotations, you must re-enable
# rotation by calling the rotate-secret operation.
svc$cancel_rotate_secret(
   SecretId = "MyTestDatabaseSecret"
)
## End(Not run)</pre>
```

securityhub

AWS SecurityHub

Description

Security Hub provides you with a comprehensive view of your security state in Amazon Web Services and helps you assess your Amazon Web Services environment against security industry standards and best practices.

Security Hub collects security data across Amazon Web Services accounts, Amazon Web Services services, and supported third-party products and helps you analyze your security trends and identify the highest priority security issues.

To help you manage the security state of your organization, Security Hub supports multiple security standards. These include the Amazon Web Services Foundational Security Best Practices (FSBP) standard developed by Amazon Web Services, and external compliance frameworks such as the Center for Internet Security (CIS), the Payment Card Industry Data Security Standard (PCI DSS), and the National Institute of Standards and Technology (NIST). Each standard includes several security controls, each of which represents a security best practice. Security Hub runs checks against security controls and generates control findings to help you assess your compliance against security best practices.

In addition to generating control findings, Security Hub also receives findings from other Amazon Web Services services, such as Amazon GuardDuty and Amazon Inspector, and supported third-party products. This gives you a single pane of glass into a variety of security-related issues. You can also send Security Hub findings to other Amazon Web Services services and supported third-party products.

Security Hub offers automation features that help you triage and remediate security issues. For example, you can use automation rules to automatically update critical findings when a security check fails. You can also leverage the integration with Amazon EventBridge to trigger automatic responses to specific findings.

This guide, the *Security Hub API Reference*, provides information about the Security Hub API. This includes supported resources, HTTP methods, parameters, and schemas. If you're new to Security Hub, you might find it helpful to also review the *Security Hub User Guide*. The user guide explains key concepts and provides procedures that demonstrate how to use Security Hub features.

It also provides information about topics such as integrating Security Hub with other Amazon Web Services services.

In addition to interacting with Security Hub by making calls to the Security Hub API, you can use a current version of an Amazon Web Services command line tool or SDK. Amazon Web Services provides tools and SDKs that consist of libraries and sample code for various languages and platforms, such as PowerShell, Java, Go, Python, C++, and .NET. These tools and SDKs provide convenient, programmatic access to Security Hub and other Amazon Web Services services . They also handle tasks such as signing requests, managing errors, and retrying requests automatically. For information about installing and using the Amazon Web Services tools and SDKs, see Tools to Build on Amazon Web Services.

With the exception of operations that are related to central configuration, Security Hub API requests are executed only in the Amazon Web Services Region that is currently active or in the specific Amazon Web Services Region that you specify in your request. Any configuration or settings change that results from the operation is applied only to that Region. To make the same change in other Regions, call the same API operation in each Region in which you want to apply the change. When you use central configuration, API requests for enabling Security Hub, standards, and controls are executed in the home Region and all linked Regions. For a list of central configuration operations, see the Central configuration terms and concepts section of the Security Hub User Guide.

The following throttling limits apply to Security Hub API operations.

- batch_enable_standards RateLimit of 1 request per second. BurstLimit of 1 request per second.
- get_findings RateLimit of 3 requests per second. BurstLimit of 6 requests per second.
- batch_import_findings RateLimit of 10 requests per second. BurstLimit of 30 requests per second.
- batch_update_findings RateLimit of 10 requests per second. BurstLimit of 30 requests per second.
- update_standards_control RateLimit of 1 request per second. BurstLimit of 5 requests per second.
- All other operations RateLimit of 10 requests per second. BurstLimit of 30 requests per second.

Usage

```
securityhub(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

· credentials:

– creds:

- * access_key_id: AWS access key ID
- * secret_access_key: AWS secret access key
- * session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

```
svc <- securityhub(
  config = list(
    credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"</pre>
```

securitylake

Amazon Security Lake

Description

Amazon Security Lake is a fully managed security data lake service. You can use Security Lake to automatically centralize security data from cloud, on-premises, and custom sources into a data lake that's stored in your Amazon Web Services account. Amazon Web Services Organizations is an account management service that lets you consolidate multiple Amazon Web Services accounts into an organization that you create and centrally manage. With Organizations, you can create member accounts and invite existing accounts to join your organization. Security Lake helps you analyze security data for a more complete understanding of your security posture across the entire organization. It can also help you improve the protection of your workloads, applications, and data.

The data lake is backed by Amazon Simple Storage Service (Amazon S3) buckets, and you retain ownership over your data.

Amazon Security Lake integrates with CloudTrail, a service that provides a record of actions taken by a user, role, or an Amazon Web Services service. In Security Lake, CloudTrail captures API calls for Security Lake as events. The calls captured include calls from the Security Lake console and code calls to the Security Lake API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for Security Lake. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in Event history. Using the information collected by CloudTrail you can determine the request that was made to Security Lake, the IP address from which the request was made, who made the request, when it was made, and additional details. To learn more about Security Lake information in CloudTrail, see the Amazon Security Lake User Guide.

Security Lake automates the collection of security-related log and event data from integrated Amazon Web Services services and third-party services. It also helps you manage the lifecycle of data

securitylake 95

with customizable retention and replication settings. Security Lake converts ingested data into Apache Parquet format and a standard open-source schema called the Open Cybersecurity Schema Framework (OCSF).

Other Amazon Web Services services and third-party services can subscribe to the data that's stored in Security Lake for incident response and security data analytics.

Usage

```
securitylake(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile
 is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

96 securitylake

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- securitylake(</pre>
  config = list(
    credentials = list(

AWS Single Sign-On

SSO

Description

AWS IAM Identity Center (successor to AWS Single Sign-On) Portal is a web service that makes it easy for you to assign user access to IAM Identity Center resources such as the AWS access portal. Users can get AWS account applications and roles assigned to them and get federated into the application.

sso 101

Although AWS Single Sign-On was renamed, the sso and identitystore API namespaces will continue to retain their original name for backward compatibility purposes. For more information, see IAM Identity Center rename.

This reference guide describes the IAM Identity Center Portal operations that you can call programatically and includes detailed information on data types and errors.

AWS provides SDKs that consist of libraries and sample code for various programming languages and platforms, such as Java, Ruby, .Net, iOS, or Android. The SDKs provide a convenient way to create programmatic access to IAM Identity Center and other AWS services. For more information about the AWS SDKs, including how to download and install them, see Tools for Amazon Web Services.

Usage

```
sso(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client. Optional shorthand for AWS Region used in instantiating the client.

region

102 sso

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- sso(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
   creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
 endpoint = "string",
 region = "string"
)
```

Operations

get_role_credentials list_account_roles list_accounts logout Returns the STS short-term credentials for a given role name that is assigned to the user Lists all roles that are assigned to the user for a given AWS account

Lists all AWS accounts assigned to the user

Removes the locally stored SSO tokens from the client-side cache and sends an API call to the IAM Ide

Examples

```
## Not run:
svc <- sso()
svc$get_role_credentials(
  Foo = 123
)
## End(Not run)</pre>
```

ssoadmin

AWS Single Sign-On Admin

Description

IAM Identity Center (successor to Single Sign-On) helps you securely create, or connect, your workforce identities and manage their access centrally across Amazon Web Services accounts and applications. IAM Identity Center is the recommended approach for workforce authentication and authorization in Amazon Web Services, for organizations of any size and type.

IAM Identity Center uses the sso and identitystore API namespaces.

This reference guide provides information on single sign-on operations which could be used for access management of Amazon Web Services accounts. For information about IAM Identity Center features, see the IAM Identity Center User Guide.

Many operations in the IAM Identity Center APIs rely on identifiers for users and groups, known as principals. For more information about how to work with principals and principal IDs in IAM Identity Center, see the Identity Store API Reference.

Amazon Web Services provides SDKs that consist of libraries and sample code for various programming languages and platforms (Java, Ruby, .Net, iOS, Android, and more). The SDKs provide a convenient way to create programmatic access to IAM Identity Center and other Amazon Web Services services. For more information about the Amazon Web Services SDKs, including how to download and install them, see Tools for Amazon Web Services.

Usage

```
ssoadmin(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token

- profile: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

```
svc <- ssoadmin(
  config = list(
    credentials = list(
      creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",</pre>
```

```
timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
),
    credentials = list(
        creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
    ),
    profile = "string",
        anonymous = "logical"
),
    endpoint = "string",
    region = "string"
)
```

ssooide

AWS SSO OIDC

Description

IAM Identity Center OpenID Connect (OIDC) is a web service that enables a client (such as CLI or a native application) to register with IAM Identity Center. The service also enables the client to fetch the user's access token upon successful authentication and authorization with IAM Identity Center.

IAM Identity Center uses the sso and identitystore API namespaces.

Considerations for Using This Guide

Before you begin using this guide, we recommend that you first review the following important information about how the IAM Identity Center OIDC service works.

- The IAM Identity Center OIDC service currently implements only the portions of the OAuth 2.0 Device Authorization Grant standard (https://tools.ietf.org/html/rfc8628) that are necessary to enable single sign-on authentication with the CLI.
- With older versions of the CLI, the service only emits OIDC access tokens, so to obtain a new token, users must explicitly re-authenticate. To access the OIDC flow that supports token refresh and doesn't require re-authentication, update to the latest CLI version (1.27.10 for CLI V1 and 2.9.0 for CLI V2) with support for OIDC token refresh and configurable IAM Identity Center session durations. For more information, see Configure Amazon Web Services access portal session duration.
- The access tokens provided by this service grant access to all Amazon Web Services account entitlements assigned to an IAM Identity Center user, not just a particular application.
- The documentation in this guide does not describe the mechanism to convert the access token into Amazon Web Services Auth ("sigv4") credentials for use with IAM-protected Amazon Web Services service endpoints. For more information, see GetRoleCredentials in the IAM Identity Center Portal API Reference Guide.

For general information about IAM Identity Center, see What is IAM Identity Center? in the IAM Identity Center User Guide.

Usage

```
ssooidc(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

108 ssooide

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

```
svc <- ssooidc(
  config = list(
    credentials = list(
    creds = list(
    access_key_id = "string",</pre>
```

sts

AWS Security Token Service

Description

Security Token Service

Security Token Service (STS) enables you to request temporary, limited-privilege credentials for users. This guide provides descriptions of the STS API. For more information about using this service, see Temporary Security Credentials.

Usage

```
sts(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * **session_token**: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client. Optional shorthand for AWS Region used in instantiating the client.

region

sts 111

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- sts(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string";
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  endpoint = "string",
  region = "string"
)
```

Operations

assume_role assume_role_with_saml assume_role_with_web_identity assume_root decode_authorization_message get_access_key_info get_caller_identity get_federation_token Returns a set of temporary security credentials that you can use to access Amazon Web Ser Returns a set of temporary security credentials for users who have been authenticated via a Returns a set of temporary security credentials for users who have been authenticated in a Returns a set of short term credentials you can use to perform privileged tasks on a member Decodes additional information about the authorization status of a request from an encoded Returns the account identifier for the specified access key ID

Returns details about the IAM user or role whose credentials are used to call the operation Returns a set of temporary security credentials (consisting of an access key ID, a secret acc

get_session_token

Returns a set of temporary credentials for an Amazon Web Services account or IAM user

Examples

```
## Not run:
svc <- sts()
svc$assume_role(
 ExternalId = "123ABC",
 Policy = "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Stmt1\",\"Effect\":\"A...",

      Key = "Cost-Center",
      Value = "12345"
   )
 ),
 TransitiveTagKeys = list(
    "Project",
    "Cost-Center"
 )
)
## End(Not run)
```

verifiedpermissions

Amazon Verified Permissions

Description

Amazon Verified Permissions is a permissions management service from Amazon Web Services. You can use Verified Permissions to manage permissions for your application, and authorize user access based on those permissions. Using Verified Permissions, application developers can grant access based on information about the users, resources, and requested actions. You can also evaluate additional information like group membership, attributes of the resources, and session context, such as time of request and IP addresses. Verified Permissions manages these permissions by letting you

create and store authorization policies for your applications, such as consumer-facing web sites and enterprise business systems.

Verified Permissions uses Cedar as the policy language to express your permission requirements. Cedar supports both role-based access control (RBAC) and attribute-based access control (ABAC) authorization models.

For more information about configuring, administering, and using Amazon Verified Permissions in your applications, see the Amazon Verified Permissions User Guide.

For more information about the Cedar policy language, see the Cedar Policy Language Guide.

When you write Cedar policies that reference principals, resources and actions, you can define the unique identifiers used for each of those elements. We strongly recommend that you follow these best practices:

Use values like universally unique identifiers (UUIDs) for all principal and resource identifiers.

For example, if user jane leaves the company, and you later let someone else use the name jane, then that new user automatically gets access to everything granted by policies that still reference User::"jane". Cedar can't distinguish between the new user and the old. This applies to both principal and resource identifiers. Always use identifiers that are guaranteed unique and never reused to ensure that you don't unintentionally grant access because of the presence of an old identifier in a policy.

Where you use a UUID for an entity, we recommend that you follow it with the // comment specifier and the 'friendly' name of your entity. This helps to make your policies easier to understand. For example: principal == User::"a1b2c3d4-e5f6-a1b2-c3d4-EXAMPLE11111", // alice

• Do not include personally identifying, confidential, or sensitive information as part of the unique identifier for your principals or resources. These identifiers are included in log entries shared in CloudTrail trails.

Several operations return structures that appear similar, but have different purposes. As new functionality is added to the product, the structure used in a parameter of one operation might need to change in a way that wouldn't make sense for the same parameter in a different operation. To help you understand the purpose of each, the following naming convention is used for the structures:

- Parameter type structures that end in Detail are used in Get operations.
- Parameter type structures that end in Item are used in List operations.
- Parameter type structures that use neither suffix are used in the mutating (create and update) operations.

Usage

```
verifiedpermissions(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - **profile**: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID

waf

AWS WAF

Description

This is **AWS WAF Classic** documentation. For more information, see **AWS WAF Classic** in the developer guide.

For the latest version of AWS WAF, use the AWS WAFV2 API and see the AWS WAF Developer Guide. With the latest version, AWS WAF has a single set of endpoints for regional and global use.

This is the AWS WAF Classic API Reference for using AWS WAF Classic with Amazon Cloud-Front. The AWS WAF Classic actions and data types listed in the reference are available for protecting Amazon CloudFront distributions. You can use these actions and data types via the endpoint waf.amazonaws.com. This guide is for developers who need detailed information about the AWS WAF Classic API actions, data types, and errors. For detailed information about AWS WAF Classic features and an overview of how to use the AWS WAF Classic API, see the AWS WAF Classic in the developer guide.

Usage

```
waf(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

· credentials:

– creds:

- * access_key_id: AWS access key ID
- * secret_access_key: AWS secret access key
- * session_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- waf(
  config = list(
    credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
  ),
  profile = "string",
  anonymous = "logical"</pre>
```

wafregional

AWS WAF Regional

Description

This is **AWS WAF Classic Regional** documentation. For more information, see **AWS WAF Classic** in the developer guide.

For the latest version of AWS WAF, use the AWS WAFV2 API and see the AWS WAF Developer Guide. With the latest version, AWS WAF has a single set of endpoints for regional and global use.

This is the AWS WAF Regional Classic API Reference for using AWS WAF Classic with the AWS resources, Elastic Load Balancing (ELB) Application Load Balancers and API Gateway APIs. The AWS WAF Classic actions and data types listed in the reference are available for protecting Elastic Load Balancing (ELB) Application Load Balancers and API Gateway APIs. You can use these actions and data types by means of the endpoints listed in AWS Regions and Endpoints. This guide is for developers who need detailed information about the AWS WAF Classic API actions, data types, and errors. For detailed information about AWS WAF Classic features and an overview of how to use the AWS WAF Classic API, see the AWS WAF Classic in the developer guide.

Usage

```
wafregional(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

Arguments

config Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- **endpoint**: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- · creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile
 is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- wafregional(
  config = list(
    credentials = list(
    creds = list(
    access_key_id = "string",</pre>
```

```
secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  endpoint = "string",
  region = "string"
)
```

Operations

wafv2

AWS WAFV2

Description

WAF

This is the latest version of the **WAF** API, released in November, 2019. The names of the entities that you use to access this API, like endpoints and namespaces, all have the versioning information added, like "V2" or "v2", to distinguish from the prior version. We recommend migrating your resources to this version, because it has a number of significant improvements.

If you used WAF prior to this release, you can't use this WAFV2 API to access any WAF resources that you created before. WAF Classic support will end on September 30, 2025.

For information about WAF, including how to migrate your WAF Classic resources to this version, see the WAF Developer Guide.

WAF is a web application firewall that lets you monitor the HTTP and HTTPS requests that are forwarded to an Amazon CloudFront distribution, Amazon API Gateway REST API, Application Load Balancer, AppSync GraphQL API, Amazon Cognito user pool, App Runner service, or Amazon Web Services Verified Access instance. WAF also lets you control access to your content, to

wafv2 125

protect the Amazon Web Services resource that WAF is monitoring. Based on conditions that you specify, such as the IP addresses that requests originate from or the values of query strings, the protected resource responds to requests with either the requested content, an HTTP 403 status code (Forbidden), or with a custom response.

This API guide is for developers who need detailed information about WAF API actions, data types, and errors. For detailed information about WAF features and guidance for configuring and using WAF, see the WAF Developer Guide.

You can make calls using the endpoints listed in WAF endpoints and quotas.

- For regional applications, you can use any of the endpoints in the list. A regional application
 can be an Application Load Balancer (ALB), an Amazon API Gateway REST API, an AppSync GraphQL API, an Amazon Cognito user pool, an App Runner service, or an Amazon
 Web Services Verified Access instance.
- For Amazon CloudFront applications, you must use the API endpoint listed for US East (N. Virginia): us-east-1.

Alternatively, you can use one of the Amazon Web Services SDKs to access an API that's tailored to the programming language or platform that you're using. For more information, see Amazon Web Services SDKs.

Usage

```
wafv2(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
 - creds:
 - * access_key_id: AWS access key ID
 - * secret_access_key: AWS secret access key
 - * session_token: AWS temporary session token
 - profile: The name of a profile to use. If not given, then the default profile is used.
 - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3_force_path_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts_regional_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

126 wafv2

- creds:
 - access_key_id: AWS access key ID
 - secret_access_key: AWS secret access key
 - session_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

Service syntax

```
svc <- wafv2(
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string";
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    profile = "string",
    anonymous = "logical"
 endpoint = "string",
  region = "string"
)
```
