Package 'photobiology'

February 3, 2025

Type Package

```
Title Photobiological Calculations
Version 0.12.0
Date 2025-01-31
Maintainer Pedro J. Aphalo <pedro.aphalo@helsinki.fi>
Description Definitions of classes, methods, operators and functions for use
      in photobiology and radiation meteorology and climatology. Calculation of
      effective (weighted) and not-weighted irradiances/doses, fluence rates,
      transmittance, reflectance, absorptance, absorbance and diverse ratios and
      other derived quantities from spectral data. Local maxima and minima: peaks,
      valleys and spikes. Conversion between energy-and photon-based units.
      Wavelength interpolation. Astronomical calculations related solar angles and
      day length. Colours and vision. This package is part of the 'r4photobiology'
      suite, Aphalo, P. J. (2015) <doi:10.19232/uv4pb.2015.1.14>.

photobiology-package photobiology: Photobiological Calculations

Description

Index

Definitions of classes, methods, operators and functions for use in photobiology and radiation meteorology and climatology. Calculation of effective (weighted) and not-weighted irradiances/doses, fluence rates, transmittance, reflectance, absorptance, absorbance and diverse ratios and other derived quantities from spectral data. Local maxima and minima: peaks, valleys and spikes. Conversion between energy-and photon-based units. Wavelength interpolation. Astronomical calculations related solar angles and day length. Colours and vision. This package is part of the 'r4photobiology' suite, Aphalo, P. J. (2015) doi:10.19232/uv4pb.2015.1.14.

Details

Package 'photobiology' is at the core of a suite of R packages supporting computations and plotting relevant to photobiology (described at https://www.r4photobiology.info/). Package 'photobiology' has its main focus in the characterization of the light environment, the description of optical properties of objects and substances and description of light responses of organisms and devices used to measure light. The facilities for spectral data storage and manipulations are widely useful in photobiology, chemistry, geophysics, radiation climatology and remote sensing. Astronomical

computations for the sun are also implemented. The design of object classes for spectral data supports reproducibility by facilitating the consistent use of units and physical quantities and consistent embedding of metadata. Data are expressed throughout using SI base units, except for wavelengths which are consistently expressed in nanometres [nm]. Please see the vignette 0: The R for Photobiology Suite for a description of the suite.

Acknowledgements

This work was funded by the Academy of Finland (decision 252548). COST Action FA9604 'UV4Growth' facilitated discussions and exchanges of ideas that lead to the development of this package. The contributions of Andy McLeod, Lars Olof Björn, Nigel Paul, Lasse Ylianttila, T. Matthew Robson and Titta Kotilainen were specially significant. Tutorials by Hadley Wickham and comments on my presentation at UseR!2015 allowed me to significantly improve the coding and functionality.

A.illuminant.spct

CIE A illuminant data

Description

A dataset containing wavelengths at a 5 nm interval (300 nm to 830 nm) and the corresponding spectral energy irradiance normalized to 1 at 560 nm. Spectrum approximates typical, domestic, tungsten-filament lighting and 'corresponds' to a black body a 2856 K. CIE standard illuminant A is intended to represent typical, domestic, tungsten-filament lighting. Original data from CIE downloaded on 2024-11-30.

Usage

```
A.illuminant.spct
```

Format

A source spectrum with 531 rows and 2 variables.

- w.length (nm)
- s.e.irrad (rel. units)

A2T 11

Note

This and other CIE illuminant spectra can be downloaded from https://cie.co.at/data-tables as .CSV files.

A2T

Convert absorbance into transmittance

Description

Function that converts absorbance (a.u.) into transmittance (fraction).

```
A2T(x, action, byref, ...)
## Default S3 method:
A2T(x, action = NULL, byref = FALSE, ...)
## S3 method for class 'numeric'
A2T(x, action = NULL, byref = FALSE, ...)
## S3 method for class 'filter_spct'
A2T(x, action = "add", byref = FALSE, ...)
## S3 method for class 'filter_mspct'
A2T(x, action = "add", byref = FALSE, ..., .parallel = FALSE, .paropts = NULL)
```

12 absorbance

Arguments

Х	an R object.
action	a character string "add" or "replace".
byref	logical indicating if new object will be created by reference or by copy of x.
	not used in current version.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A copy of x with a column Tfr added and A and Afr possibly deleted except for w.length. If action = "replace", in all cases, the additional columns are removed, even if no column needs to be added.

Methods (by class)

- A2T(default): Default method for generic function
- A2T(numeric): method for numeric vectors
- A2T(filter_spct): Method for filter spectra
- A2T(filter_mspct): Method for collections of filter spectra

See Also

```
Other quantity conversion functions: Afr2T(), T2A(), T2Afr(), any2T(), as_quantum(), e2q(), e2qmol_multipliers(), e2quantum_multipliers(), q2e()
```

Description

Function to calculate the mean, total, or other summary of absorbance for spectral data stored in a filter_spct or in an object_spct.

```
absorbance(spct, w.band, quantity, wb.trim, use.hinges, ...)
## Default S3 method:
absorbance(spct, w.band, quantity, wb.trim, use.hinges, ...)
## S3 method for class 'filter_spct'
```

absorbance 13

```
absorbance(
  spct,
  w.band = NULL,
  quantity = "average",
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
 naming = "default",
)
## S3 method for class 'object_spct'
absorbance(
  spct,
 w.band = NULL,
  quantity = "average",
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
## S3 method for class 'filter_mspct'
absorbance(
  spct,
 w.band = NULL,
  quantity = "average",
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'object_mspct'
absorbance(
  spct,
 w.band = NULL,
  quantity = "average",
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
  attr2tb = NULL,
  idx = "spct.idx"
  .parallel = FALSE,
```

14 absorbance

```
.paropts = NULL
)
```

Arguments

spct	an R object.
w.band	waveband or list of waveband objects or a numeric vector of length two. The waveband(s) determine the region(s) of the spectrum that are summarized. If a numeric range is supplied a waveband object is constructed on the fly from it.
quantity	character string One of "average" or "mean", "total", "contribution", "contribution.pc", "relative" or "relative.pc".
wb.trim	logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded.
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
	other arguments (possibly used by derived methods).
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
attr2tb	character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A named numeric vector in the case of methods for individual spectra, with one value for each waveband passed to parameter w.band. A data.frame in the case of collections of spectra, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used.

Methods (by class)

- absorbance(default): Default for generic function
- absorbance(filter_spct): Specialization for filter spectra

absorptance 15

- absorbance(object_spct): Specialization for object spectra
- absorbance(filter_mspct): Calculates absorbance from a filter_mspct
- absorbance(object_mspct): Calculates absorbance from a object_mspct

Note

The use.hinges parameter controls speed optimization. The defaults should be suitable in most cases. Only the range of wavelengths in the wavebands is used and all BSWFs are ignored.

Examples

absorptance

Absorptance

Description

Function to calculate the mean, total, or other summary of absorptance for spectral data stored in a filter_spct or in an object_spct. Absorptance is a different quantity than absorbance.

```
absorptance(spct, w.band, quantity, wb.trim, use.hinges, ...)
## Default S3 method:
absorptance(spct, w.band, quantity, wb.trim, use.hinges, ...)
## S3 method for class 'filter_spct'
absorptance(
    spct,
    w.band = NULL,
    quantity = "average",
```

16 absorptance

```
wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
)
## S3 method for class 'object_spct'
absorptance(
  spct,
 w.band = NULL,
  quantity = "average",
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
)
## S3 method for class 'filter_mspct'
absorptance(
  spct,
 w.band = NULL,
  quantity = "average",
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
 naming = "default",
  . . . ,
  attr2tb = NULL,
  idx = "spct.idx"
)
## S3 method for class 'object_mspct'
absorptance(
  spct,
 w.band = NULL,
  quantity = "average",
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
  . . . ,
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct an R object.

absorptance 17

w.band	waveband or list of waveband objects or a numeric vector of length two. The waveband(s) determine the region(s) of the spectrum that are summarized. If a numeric range is supplied a waveband object is constructed on the fly from it.

- absorptance(filter_mspct): Calculates absorptance from a filter_mspct
- absorptance(object_mspct): Calculates absorptance from a object_mspct

18 add_attr2tb

Note

The use.hinges parameter controls speed optimization. The defaults should be suitable in most cases. Only the range of wavelengths in the wavebands is used and all BSWFs are ignored.

Examples

add_attr2tb

Copy attributes from members of a generic_mspct

Description

Copy metadata attributes from members of a generic_mspct object into a tibble or data.frame.

```
add_attr2tb(
  tb = NULL,
  mspct,
  col.names = NULL,
  idx = "spct.idx",
  unnest = FALSE
)

when_measured2tb(mspct, tb = NULL, col.names = "when.measured", idx = NULL)
geocode2tb(mspct, tb = NULL, col.names = "geocode", idx = "spct.idx")

lonlat2tb(mspct, tb = NULL, col.names = c("lon", "lat"), idx = "spct.idx")

lon2tb(mspct, tb = NULL, col.names = "lon", idx = "spct.idx")
```

add_attr2tb

```
lat2tb(mspct, tb = NULL, col.names = "lat", idx = "spct.idx")
address2tb(mspct, tb = NULL, col.names = "address", idx = "spct.idx")
what_measured2tb(
 mspct,
 tb = NULL,
 col.names = "what.measured",
 idx = "spct.idx"
)
how_measured2tb(mspct, tb = NULL, col.names = "how.measured", idx = "spct.idx")
normalized2tb(mspct, tb = NULL, col.names = "normalized", idx = "spct.idx")
scaled2tb(mspct, tb = NULL, col.names = "scaled", idx = "spct.idx")
instr_desc2tb(mspct, tb = NULL, col.names = "instr.desc", idx = "spct.idx")
instr_settings2tb(
 mspct,
 tb = NULL,
 col.names = "instr.settings",
 idx = "spct.idx"
)
BSWF_used2tb(mspct, tb = NULL, col.names = "BSWF.used", idx = "spct.idx")
filter_properties2tb(
 mspct,
  tb = NULL,
 col.names = "filter.properties",
 idx = "spct.idx"
)
solute_properties2tb(
 mspct,
 tb = NULL,
 col.names = "solute.properties",
 idx = "spct.idx"
Tfr_type2tb(mspct, tb = NULL, col.names = "Tfr.type", idx = "spct.idx")
Rfr_type2tb(mspct, tb = NULL, col.names = "Rfr.type", idx = "spct.idx")
time_unit2tb(mspct, tb = NULL, col.names = "time.unit", idx = "spct.idx")
```

20 add_attr2tb

```
comment2tb(mspct, tb = NULL, col.names = "comment", idx = "spct.idx")
```

Arguments

tb tibble or data.frame to which to add the data (optional).

mspct generic_mspct Any collection of spectra.

col.names named character vector Name(s) of metadata attributes to copy, while if named,

the names provide the name for the column.

idx character Name of the column with the names of the members of the collection

of spectra.

unnest logical Flag controlling if metadata attributes that are lists of values should be

returned in a list column or in separate columns.

Details

The attributes are copied to a column in a tibble or data frame. If the tb formal parameter receives NULL as argument, a new tibble will be created. If an existing data.frame or tibble is passed as argument, new columns are added to it. However, the number of rows in the argument passed to tb must match the number of spectra in the argument passed to mspct. Only in the case of method add_attr2tb() if the argument to col.names is a named vector, the names of members are used as names for the columns created. This permits setting any valid name for the new columns. If the vector passed to col.names has no names the names of the attributes are used for the new columns. If the fields of the attributes are unnested their names are used as names for the columns.

```
Valid accepted as argument to col.names are NULL, "lon", "lat", "address", "geocode", "where.measured", "when.measured", "what.measured", "how.measured", "comment", "normalised", "normalized", "scaled", "bswf.used", "instr.desc", "instr.settings", solute.properties, "filter.properties", "Tfr.type", "Rfr.type", "time.unit".
```

Value

A tibble With the metadata attributes in separate new variables.

Note

The order of the first two arguments is reversed in add_attr2tb() compared to the other functions. This is to allow its use in 'pipes', while the functions for single attributes are expected to be used mostly to create new tibbles.

```

Afr2T 21

Examples

Afr2T

Convert transmittance into absorptance.

Description

Function that converts transmittance (fraction) into absorptance (fraction). If reflectance (fraction) is available, it allows conversions between internal and total absorptance.

```
Afr2T(x, action, byref, clean, ...)
## Default S3 method:
Afr2T(x, action = NULL, byref = FALSE, clean = FALSE, ...)
## S3 method for class 'numeric'
Afr2T(x, action = NULL, byref = FALSE, clean = FALSE, Rfr = NA_real_, ...)
## S3 method for class 'filter_spct'
Afr2T(x, action = "add", byref = FALSE, clean = FALSE, ...)
## S3 method for class 'object_spct'
Afr2T(x, action = "add", byref = FALSE, clean = FALSE, ...)
## S3 method for class 'filter_mspct'
Afr2T(
  Х,
  action = "add",
  byref = FALSE,
  clean = FALSE,
  .parallel = FALSE,
  .paropts = NULL
```

22 Afr2T

```
## S3 method for class 'object_mspct'
Afr2T(
    x,
    action = "add",
    byref = FALSE,
    clean = FALSE,
    ...,
    .parallel = FALSE,
    .paropts = NULL
)
```

Arguments

X	an R object
action	character Allowed values "replace" and "add"
byref	logical indicating if new object will be created by reference or by copy of x
clean	logical replace off-boundary values before conversion
	not used in current version
Rfr	numeric vector. Spectral reflectance o reflectance factor. Set to zero if \boldsymbol{x} is internal reflectance,
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A copy of x with a column Tfr added and other columns possibly deleted except for w.length. If action = "replace", in all cases, the additional columns are removed, even if no column needs to be added.

Methods (by class)

- Afr2T(default): Default method for generic function
- Afr2T(numeric): Default method for generic function
- Afr2T(filter_spct): Method for filter spectra
- Afr2T(object_spct): Method for object spectra
- Afr2T(filter_mspct): Method for collections of filter spectra
- Afr2T(object_mspct): Method for collections of object spectra

```

any2T 23

Examples

```
T2Afr(Ler_leaf.spct)
```

any2T

Convert filter quantities.

Description

Functions that convert or add related physical quantities to filter_spct or object_spct objects. transmittance (fraction) into absorptance (fraction).

Usage

```
any2T(x, action = "add", clean = FALSE)
any2A(x, action = "add", clean = FALSE)
any2Afr(x, action = "add", clean = FALSE)
```

Arguments

x an filter_spct or a filter_mspct object.
 action character Allowed values "replace" and "add".
 clean logical replace off-boundary values before conversion

Details

These functions are dispatchers for A2T, Afr2T, T2A, and T2Afr. The dispatch is based on the names of the variables stored in x. They do not support in-place modification of x.

Value

A copy of x with the columns for the different quantities added or replaced. If action = "replace", in all cases, the additional columns are removed, even if no column needs to be added.

any2T(polyester.spct)
```

24 as.calibration_mspct

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.calibration_mspct(x, ...)
## Default S3 method:
as.calibration_{mspct}(x, \ldots)
## S3 method for class 'data.frame'
as.calibration_mspct(x, ...)
## S3 method for class 'calibration_spct'
as.calibration_mspct(x, ...)
## S3 method for class 'list'
as.calibration_mspct(x, ..., ncol = 1, byrow = FALSE)
## S3 method for class 'matrix'
as.calibration_mspct(
 Х,
 w.length,
  spct.data.var = "irrad.mult",
 multiplier = 1,
 byrow = NULL,
  spct.names = "spct_",
)
```

Arguments

X	a list of spectral objects or a list of objects such as data frames that can be converted into spectral objects.
	passed to individual spectrum object constructor
ncol	integer Number of 'virtual' columns in data
byrow	logical If ncol > 1 how to read in the data
w.length	numeric A vector of wavelengthvalues sorted in strictly ascending order (nm).
spct.data.var	character The name of the variable that will contain the spectral data. This indicates what physical quantity is stored in the matrix and the units of expression used.

as.calibration_spct 25

multiplier	numeric A multiplier to be applied to the values in x to do unit or scale conversion.
spct.names	character Vector of names to be assigned to collection members, either of length 1, or with length equal to the number of spectra.

Value

A copy of x converted into a calibration_mspctt object.

Methods (by class)

```
• as.calibration_mspct(default):
```

- as.calibration_mspct(data.frame):
- as.calibration_mspct(calibration_spct):
- as.calibration_mspct(list):
- as.calibration_mspct(matrix):

Note

When x is a square matrix an explicit argument is needed for byrow to indicate how data in x should be read. In every case the length of the w.length vector must match one of the dimensions of x.

```

```
as.calibration_spct Coerce to a spectrum
```

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.calibration_spct(x, ...)
## Default S3 method:
as.calibration_spct(x, ...)
```

Arguments

```
x an R object.
```

... other arguments passed to "set" functions.

26 as.chroma_mspct

Value

A copy of x converted into a calibration_spct object.

Methods (by class)

• as.calibration_spct(default):

setGenericSpct
```

```
Other constructors of spectral objects: as.chroma_spct(), as.cps_spct(), as.filter_spct(), as.generic_spct(), as.object_spct(), as.raw_spct(), as.reflector_spct(), as.response_spct(), as.solute_spct(), as.source_spct(), source_spct()
```

as.chroma_mspct

Coerce to a collection-of-spectra

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.chroma_mspct(x, ...)
## Default S3 method:
as.chroma_mspct(x, ...)
## S3 method for class 'data.frame'
as.chroma_mspct(x, ...)
## S3 method for class 'chroma_spct'
as.chroma_mspct(x, ...)
## S3 method for class 'list'
as.chroma_mspct(x, ..., ncol = 1, byrow = FALSE)
```

Arguments

X	a list of spectral objects or a list of objects such as data frames that can be converted into spectral objects.
	passed to individual spectrum object constructor
ncol	integer Number of 'virtual' columns in data
bvrow	logical If ncol > 1 how to read in the data

as.chroma_spct 27

Value

A copy of x converted into a chroma_mspct object.

Methods (by class)

```
as.chroma_mspct(default):as.chroma_mspct(data.frame):
```

```
• as.chroma_mspct(chroma_spct):
```

```

Coerce to a collection-of-spectra

Description

Return a copy of an R object with its class set to a given type of spectrum.

as.filter_mspct 31

```
byrow = FALSE
)

## S3 method for class 'matrix'
as.filter_mspct(
    x,
    w.length,
    spct.data.var = "Tfr",
    multiplier = 1,
    byrow = NULL,
    spct.names = "spct_",
    ...
)
```

Arguments

a list of spectral objects or a list of objects such as data frames that can be Х converted into spectral objects. passed to individual spectrum object constructor . . . a character string, either "total" or "internal" Tfr.type strict.range logical Flag indicating how off-range values are handled ncol integer Number of 'virtual' columns in data byrow logical If ncol > 1 how to read in the data w.length numeric A vector of wavelengthvalues sorted in strictly ascending order (nm). character The name of the variable that will contain the spectral data. This indispct.data.var cates what physical quantity is stored in the matrix and the units of expression used. multiplier numeric A multiplier to be applied to the values in x to do unit or scale conversion. character Vector of names to be assigned to collection members, either of length spct.names

1, or with length equal to the number of spectra.

Value

A copy of x converted into a filter_mspct object.

Methods (by class)

```
as.filter_mspct(default):
as.filter_mspct(data.frame):
as.filter_mspct(filter_spct):
as.filter_mspct(list):
as.filter_mspct(matrix):
```

32 as.filter_spct

Note

When x is a square matrix an explicit argument is needed for byrow to indicate how data in x should be read. In every case the length of the x-length vector must match one of the dimensions of x.

See Also

```
Other Coercion methods for collections of spectra: as.calibration_mspct(), as.chroma_mspct(), as.cps_mspct(), as.generic_mspct(), as.object_mspct(), as.raw_mspct(), as.reflector_mspct(), as.response_mspct(), as.solute_mspct(), as.source_mspct(), split2mspct(), subset2mspct()
```

as.filter_spct

Coerce or convert into a filter spectrum

Description

Return a possibly modified copy of an R object with its class set to a filter spectrum. In the case of conversion from a solute_spct object, compute the spectral quantity based on additional input from user.

```
as.filter_spct(x, ...)
## Default S3 method:
as.filter_spct(
  Tfr.type = c("total", "internal"),
  strict.range = getOption("photobiology.strict.range", default = FALSE),
)
## S3 method for class 'solute_spct'
as.filter_spct(
  Х,
  Tfr.type = "internal",
  strict.range = getOption("photobiology.strict.range", default = FALSE),
  Rfr.constant = NA_real_,
  comment = NULL,
  molar.concentration = NULL,
  mass.concentration = NULL,
  path.length = 1,
)
```

as.generic_mspct 33

Arguments

x	an R object.	
	other arguments passed to "set" functions.	
Tfr.type	a character string, either "total" or "internal".	
strict.range	logical Flag indicating whether off-range values result in an error instead of a warning.	
Rfr.constant	numeric The value of the reflection factor (/1) to be set.	
comment	character A string to be added as a comment attribute to the object created. If not supplied, the comment will be copied from x.	
molar.concentration, mass.concentration		
	numeric Concentration to be used to compute transmittance of the solute in solution [$mol\ m^{-3}=mmol\ dm^{-3}$ or $kg\ m^{-3}=g\ dm^{-3}$, respectively].	
path.length	numeric The length of the light path (m) used to compute transmittance of the	

Value

A copy of x converted into a filter_spct. object.

solute in a solution.

Methods (by class)

- as.filter_spct(default):
- as.filter_spct(solute_spct):

```
setGenericSpct
```

```
Other constructors of spectral objects: as.calibration_spct(), as.chroma_spct(), as.cps_spct(), as.generic_spct(), as.object_spct(), as.raw_spct(), as.reflector_spct(), as.response_spct(), as.solute_spct(), as.source_spct(), source_spct()
```

```
as.generic_mspct Coerce to a collection-of-spectra
```

Description

Return a copy of an R object with its class set to a given type of spectrum.

34 as.generic_mspct

Usage

```
as.generic_mspct(x, ...)
## Default S3 method:
as.generic_mspct(x, ...)
## S3 method for class 'data.frame'
as.generic_mspct(x, force.spct.class = FALSE, ...)
## S3 method for class 'generic_spct'
as.generic_mspct(x, force.spct.class = FALSE, ...)
## S3 method for class 'list'
as.generic_mspct(x, force.spct.class = FALSE, ..., ncol = 1, byrow = FALSE)
## S3 method for class 'matrix'
as.generic_mspct(
  Х,
 w.length,
 member.class,
  spct.data.var,
 multiplier = 1,
  byrow = NULL,
  spct.names = "spct_",
)
mat2mspct(
  х,
 w.length,
 member.class,
  spct.data.var,
 multiplier = 1,
  byrow = NULL,
  spct.names = "spct_",
)
```

Arguments

x a list of spectral objects or a list of objects such as data frames that can be converted into spectral objects.

... passed to individual spectrum object constructor

force.spct.class

logical indicating whether to change the class of members to generic_spct or retain the existing class.

ncol integer Number of 'virtual' columns in data

as.generic_mspct 35

byrow	logical If ncol > 1 how to read in the data
w.length	numeric A vector of wavelengthvalues sorted in strictly ascending order (nm).
member.class	character The name of the class of the individual spectra to be constructed.
spct.data.var	character The name of the variable that will contain the spectral data. This indicates what physical quantity is stored in the matrix and the units of expression used.
multiplier	numeric A multiplier to be applied to the values in x to do unit or scale conversion.
spct.names	character Vector of names to be assigned to collection members, either of length 1, or with length equal to the number of spectra.

Value

A copy of x converted into a generic_mspct object.

Methods (by class)

```
as.generic_mspct(default):
as.generic_mspct(data.frame):
as.generic_mspct(generic_spct):
as.generic_mspct(list):
as.generic_mspct(matrix):
```

Note

Members of generic_mspct objects can be heterogeneous: they can belong to any class derived from generic_spct and class is not enforced. When x is a list of data frames force.spct.class = TRUE needs to be supplied. When x is a square matrix an explicit argument is needed for byrow to indicate how data in x should be read. In every case the length of the w.length vector must match one of the dimensions of x.

See Also

```
Other Coercion methods for collections of spectra: as.calibration_mspct(), as.chroma_mspct(), as.cps_mspct(), as.filter_mspct(), as.object_mspct(), as.raw_mspct(), as.reflector_mspct(), as.response_mspct(), as.solute_mspct(), as.source_mspct(), split2mspct(), subset2mspct()
```

36 as.matrix-mspct

as.generic_spct

Coerce to a spectrum

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.generic_spct(x, ...)
## Default S3 method:
as.generic_spct(x, ...)
```

Arguments

x an R object

... other arguments passed to "set" functions

Value

A copy of x converted into a generic_spct object.

Methods (by class)

• as.generic_spct(default):

See Also

```
setGenericSpct
```

```
Other constructors of spectral objects: as.calibration_spct(), as.chroma_spct(), as.cps_spct(), as.filter_spct(), as.object_spct(), as.raw_spct(), as.reflector_spct(), as.response_spct(), as.solute_spct(), as.source_spct(), source_spct()
```

as.matrix-mspct

Coerce a collection of spectra into a matrix

Description

Convert an object of class generic_mspct or a derived class into an R matrix with wavelengths saved as an attribute and spectral data in rows or columns.

as.object_mspct 37

Usage

```
## S3 method for class 'generic_mspct'
as.matrix(x, spct.data.var, byrow = attr(x, "mspct.byrow"), ...)
mspct2mat(x, spct.data.var, byrow = attr(x, "mspct.byrow"), ...)
```

Arguments

```
x generic_mspct object.

spct.data.var character The name of the variable containing the spectral data.

byrow logical. If FALSE (the default) the matrix is filled with the spectra stored by columns, otherwise the matrix is filled by rows.

... currently ignored.
```

Warning!

This conversion preserves the spectral data but discards almost all the metadata contained in the spectral objects. In other words a matrix created with this function cannot be used to recreate the original object unless the same metadata is explicitly supplied when converting the matrix into new collection of spectra.

Note

Only collections of spectra containing spectra with exactly the same w.length values can by converted. If needed, the spectra can be re-expressed before attempting the conversion to a matrix.

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.object_mspct(x, ...)
## Default S3 method:
as.object_mspct(x, ...)
## S3 method for class 'data.frame'
as.object_mspct(
    x,
    Tfr.type = c("total", "internal"),
    Rfr.type = c("total", "specular"),
    strict.range = TRUE,
```

38 as.object_mspct

```
## S3 method for class 'object_spct'
as.object_mspct(x, ...)

## S3 method for class 'list'
as.object_mspct(
    x,
    Tfr.type = c("total", "internal"),
    Rfr.type = c("total", "specular"),
    strict.range = TRUE,
    ...,
    ncol = 1,
    byrow = FALSE
)
```

Arguments

X	a list of spectral objects or a list of objects such as data frames that can be converted into spectral objects.
	passed to individual spectrum object constructor
Tfr.type	a character string, either "total" or "internal"
Rfr.type	a character string, either "total" or "specular"
strict.range	logical Flag indicating how off-range values are handled
ncol	integer Number of 'virtual' columns in data
byrow	logical If nco1 > 1 how to read in the data

Value

A copy of x converted into a object_mspct object.

Methods (by class)

```
as.object_mspct(default):as.object_mspct(data.frame):as.object_mspct(object_spct):as.object_mspct(list):
```

See Also

```
Other Coercion methods for collections of spectra: as.calibration_mspct(), as.chroma_mspct(), as.cps_mspct(), as.filter_mspct(), as.generic_mspct(), as.raw_mspct(), as.reflector_mspct(), as.response_mspct(), as.solute_mspct(), as.source_mspct(), split2mspct(), subset2mspct()
```

as.object_spct 39

|--|

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.object_spct(x, ...)
## Default S3 method:
as.object_spct(
    x,
    Tfr.type = c("total", "internal"),
    Rfr.type = c("total", "specular"),
    strict.range = getOption("photobiology.strict.range", default = FALSE),
    ...
)
```

Arguments

Value

A copy of x converted into a object_spct object.

Methods (by class)

```
• as.object_spct(default):
```

See Also

```
setGenericSpct
```

```
Other constructors of spectral objects: as.calibration_spct(), as.chroma_spct(), as.cps_spct(), as.filter_spct(), as.generic_spct(), as.raw_spct(), as.reflector_spct(), as.response_spct(), as.solute_spct(), as.source_spct(), source_spct()
```

40 as.raw_mspct

as.raw_mspct

Coerce to a collection-of-spectra

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.raw_mspct(x, ...)
## Default S3 method:
as.raw_mspct(x, ...)
## S3 method for class 'data.frame'
as.raw_mspct(x, ...)
## S3 method for class 'raw_spct'
as.raw_mspct(x, ...)
## S3 method for class 'list'
as.raw_mspct(x, ..., ncol = 1, byrow = FALSE)
## S3 method for class 'matrix'
as.raw_mspct(
 х,
 w.length,
  spct.data.var = "counts",
 multiplier = 1,
 byrow = NULL,
  spct.names = "spct_",
)
```

Arguments

X	a list of spectral objects or a list of objects such as data frames that can be converted into spectral objects.
	passed to individual spectrum object constructor
ncol	integer Number of 'virtual' columns in data
byrow	logical If ncol > 1 how to read in the data
w.length	numeric A vector of wavelengthvalues sorted in strictly ascending order (nm).
spct.data.var	character The name of the variable that will contain the spectral data. This indicates what physical quantity is stored in the matrix and the units of expression used.

as.raw_spct 41

multiplier numeric A multiplier to be applied to the values in x to do unit or scale conversion.

spct.names character Vector of names to be assigned to collection members, either of length

1, or with length equal to the number of spectra.

Value

A copy of x converted into a raw_mspct object.

Methods (by class)

```
as.raw_mspct(default):
as.raw_mspct(data.frame):
as.raw_mspct(raw_spct):
as.raw_mspct(list):
as.raw_mspct(matrix):
```

Note

When x is a square matrix an explicit argument is needed for byrow to indicate how data in x should be read. In every case the length of the x length vector must match one of the dimensions of x.

```
Other Coercion methods for collections of spectra: as.calibration_mspct(), as.chroma_mspct(), as.cps_mspct(), as.filter_mspct(), as.generic_mspct(), as.object_mspct(), as.reflector_mspct(), as.response_mspct(), as.solute_mspct(), as.source_mspct(), split2mspct(), subset2mspct()
```

as.raw_spct

Coerce to a spectrum

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.raw_spct(x, ...)
## Default S3 method:
as.raw_spct(x, ...)
```

Arguments

```
x an R object.
```

. . . other arguments passed to "set" functions.

42 as.reflector_mspct

Value

A copy of x converted into a raw_spct object.

Methods (by class)

```
• as.raw_spct(default):
```

See Also

```
setGenericSpct
```

```
Other constructors of spectral objects: as.calibration_spct(), as.chroma_spct(), as.cps_spct(), as.filter_spct(), as.generic_spct(), as.object_spct(), as.reflector_spct(), as.response_spct(), as.solute_spct(), as.source_spct(), source_spct()
```

as.reflector_mspct

Coerce to a collection-of-spectra

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

as.reflector_mspct 43

```
byrow = FALSE
)

## S3 method for class 'matrix'
as.reflector_mspct(
    x,
    w.length,
    spct.data.var = "Rfr",
    multiplier = 1,
    byrow = NULL,
    spct.names = "spct_",
    ...
)
```

Arguments

Х

converted into spectral objects. passed to individual spectrum object constructor . . . a character string, either "total" or "specular" Rfr.type strict.range logical Flag indicating how off-range values are handled ncol integer Number of 'virtual' columns in data byrow logical If ncol > 1 how to read in the data w.length numeric A vector of wavelengthvalues sorted in strictly ascending order (nm). character The name of the variable that will contain the spectral data. This indispct.data.var cates what physical quantity is stored in the matrix and the units of expression used. multiplier numeric A multiplier to be applied to the values in x to do unit or scale conver-

sion.

a list of spectral objects or a list of objects such as data frames that can be

spct.names character Vector of names to be assigned to collection members, either of length 1, or with length equal to the number of spectra.

Value

A copy of x converted into a reflector_mspct object.

Methods (by class)

```
as.reflector_mspct(default):
as.reflector_mspct(data.frame):
as.reflector_mspct(reflector_spct):
as.reflector_mspct(list):
as.reflector_mspct(matrix):
```

44 as.reflector_spct

Note

When x is a square matrix an explicit argument is needed for byrow to indicate how data in x should be read. In every case the length of the w.length vector must match one of the dimensions of x.

```

```
as.reflector_spct
```

Coerce to a spectrum

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.reflector_spct(x, ...)
## Default S3 method:
as.reflector_spct(
    x,
    Rfr.type = c("total", "specular"),
    strict.range = getOption("photobiology.strict.range", default = FALSE),
    ...
)
```

Arguments

```
    x an R object.
    ... other arguments passed to "set" functions.
    Rfr.type a character string, either "total" or "specular".
    strict.range logical Flag indicating whether off-range values result in an error instead of a warning.
```

Value

A copy of x converted into a reflector_spct object.

Methods (by class)

```
• as.reflector_spct(default):
```

as.response_mspct 45

See Also

```

as.response_mspct

Coerce to a collection-of-spectra

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.response\_mspct(x, ...)
## Default S3 method:
as.response_mspct(x, ...)
## S3 method for class 'data.frame'
as.response_mspct(x, time.unit = "second", ...)
## S3 method for class 'response_spct'
as.response_mspct(x, ...)
## S3 method for class 'list'
as.response_mspct(x, time.unit = "second", ..., ncol = 1, byrow = FALSE)
## S3 method for class 'matrix'
as.response_mspct(
  Х,
 w.length,
  spct.data.var = "s.e.response",
  multiplier = 1,
  byrow = NULL,
  spct.names = "spct_",
)
```

Arguments

```
    a list of spectral objects or a list of objects such as data frames that can be converted into spectral objects.
    passed to individual spectrum object constructor
    character A string, "second", "day" or "exposure"
```

46 as.response_spct

ncol	integer Number of 'virtual' columns in data
byrow	logical If ncol > 1 how to read in the data
w.length	numeric A vector of wavelengthvalues sorted in strictly ascending order (nm).
spct.data.var	character The name of the variable that will contain the spectral data. This indicates what physical quantity is stored in the matrix and the units of expression used.
multiplier	numeric A multiplier to be applied to the values in x to do unit or scale conversion.
spct.names	character Vector of names to be assigned to collection members, either of length 1, or with length equal to the number of spectra.

Value

A copy of x converted into a response_mspct object.

Methods (by class)

```
as.response_mspct(default):
as.response_mspct(data.frame):
as.response_mspct(response_spct):
as.response_mspct(list):
as.response_mspct(matrix):
```

Note

When x is a square matrix an explicit argument is needed for byrow to indicate how data in x should be read. In every case the length of the x length vector must match one of the dimensions of x.

 strict.range = TRUE,
 ncol = 1,
  byrow = FALSE
)
## S3 method for class 'matrix'
as.solute_mspct(
 Х,
 w.length,
  spct.data.var = "K.mole",
 multiplier = 1,
 byrow = NULL,
  spct.names = "spct_",
)
```

Arguments

a list of spectral objects or a list of objects such as data frames that can be Х converted into spectral objects. passed to individual spectrum object constructor a character string, either "attenuation", "absorption" or "scattering" K.type logical Flag indicating how off-range values are handled strict.range ncol integer Number of 'virtual' columns in data byrow logical If ncol > 1 how to read in the data w.length numeric A vector of wavelength values sorted in strictly ascending order (nm). spct.data.var character The name of the variable that will contain the spectral data. This indicates what physical quantity is stored in the matrix and the units of expression used. multiplier numeric A multiplier to be applied to the values in x to do unit or scale conversion. character Vector of names to be assigned to collection members, either of length spct.names 1, or with length equal to the number of spectra.

Value

A copy of x converted into a filter_mspct object.

as.solute_spct 49

Methods (by class)

```
as.solute_mspct(default):
as.solute_mspct(data.frame):
as.solute_mspct(solute_spct):
as.solute_mspct(list):
as.solute_mspct(matrix):
```

Note

When x is a square matrix an explicit argument is needed for byrow to indicate how data in x should be read. In every case the length of the w.length vector must match one of the dimensions of x.

See Also

```
Other Coercion methods for collections of spectra: as.calibration_mspct(), as.chroma_mspct(), as.cps_mspct(), as.filter_mspct(), as.generic_mspct(), as.object_mspct(), as.raw_mspct(), as.reflector_mspct(), as.response_mspct(), as.source_mspct(), split2mspct(), subset2mspct()
```

as.solute_spct

Coerce to a solute spectrum

Description

Return a possibly modified copy of an R object with its class set to solute_spct (a solute spectrum). In the case of conversion from a filter_spct object, compute spectral molar attenuation based on additional input from user.

Usage

```
as.solute_spct(x, ...)

## Default S3 method:
as.solute_spct(
    X,
    K.type = c("attenuation", "absorption", "scattering"),
    strict.range = getOption("photobiology.strict.range", default = FALSE),
    ...
)

## S3 method for class 'filter_spct'
as.solute_spct(
    X,
    K.type = c("attenuation", "absorption", "scattering"),
    name = NA_character_,
    mass = NA_character_,
    formula = NULL,
```

50 as.solute_spct

```
structure = grDevices::as.raster(matrix()),
ID = NA_character_,
solvent.name = NA_character_,
solvent.ID = NA_character_,
strict.range = getOption("photobiology.strict.range", default = FALSE),
comment = NULL,
molar.concentration = NULL,
mass.concentration = NULL,
path.length = 1,
...
)
```

Arguments

x an R object.

... other arguments passed to "set" functions.

K.type a character string, one of "attenuation", "absorption" or "scattering".

strict.range logical Flag indicating whether off-range values result in an error instead of a

warning.

name, solvent.name

character The names of the substance and of the solvent. A named character

vector, with member names such as "IUPAC" for the authority.

mass numeric The mass in Dalton (Da = g/mol).

formula character The molecular formula. structure raster A bitmap of the structure.

ID, solvent. ID character The IDs of the substance and of the solvent. A named character vector,

with member names such as "ChemSpider" or "PubChen" for the authority.

comment character A string to be added as a comment attribute to the object created. If

not supplied, the comment will be copied from x.

molar.concentration, mass.concentration

numeric Concentration to be used to compute transmittance of the solute in so-

lution $[mol \, m^{-3} = mmol \, dm^{-3} \text{ or } kg \, m^{-3} = g \, dm^{-3}, \text{ respectively}].$

path.length numeric The length of the light path (m) used to compute transmittance of the

solute in a solution.

Value

A copy of x converted into a solute_spct object.

Methods (by class)

```
• as.solute_spct(default):
```

• as.solute_spct(filter_spct):

as.source_mspct 51

See Also

```
setSoluteSpct
```

```
Other constructors of spectral objects: as.calibration_spct(), as.chroma_spct(), as.cps_spct(), as.filter_spct(), as.generic_spct(), as.object_spct(), as.raw_spct(), as.reflector_spct(), as.response_spct(), as.source_spct(), source_spct()
```

as.source_mspct

Coerce to a collection-of-spectra

Description

Return a copy of an R object with its class set to a given type of spectrum.

Usage

```
as.source_mspct(x, ...)
## Default S3 method:
as.source_mspct(x, ...)
## S3 method for class 'data.frame'

```

as_energy

Convert spectral photon irradiance into spectral energy irradiance

Description

Convert a spectral photon irradiance $[mol \ s^{-1} \ m^{-2} \ nm^{-1}]$ into a spectral energy irradiance $[W \ m^{-2} \ nm^{-1}]$.

Usage

```
as_energy(w.length, s.qmol.irrad)
```

Arguments

```
w. length numeric vector of wavelengths [nm]).
```

s.qmol.irrad numeric vector of spectral photon irradiance values.

Value

A numeric vector of spectral (energy) irradiances.

See Also

```
Other low-level functions operating on numeric vectors:: as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

```
with(sun.spct, as_energy(w.length, s.q.irrad))
```

as_quantum 55

as_quantum

Convert spectral energy irradiance into spectral photon irradiance

Description

Convert spectral energy irradiance [W m-2 nm-1] into spectral photon irradiance expressed as number of photons [s-1 m-2 nm-1]

Usage

```
as_quantum(w.length, s.e.irrad)
```

Arguments

w.length numeric vector of wavelengths (nm).

s.e.irrad numeric vector of spectral (energy) irradiance values.

Value

A numeric vector of spectral photon irradiances.

See Also

```
Other quantity conversion functions: A2T(), Afr2T(), T2A(), T2Afr(), any2T(), e2q(), e2qmol_multipliers(), e2quantum_multipliers(), q2e()
```

Examples

```
with(sun.data, as_quantum(w.length, s.e.irrad))
```

as_quantum_mol

Convert spectral energy irradiance into spectral photon irradiance

Description

Convert spectral energy irradiance $[W m^{-2} nm^{-1}]$ into a spectral photon irradiance expressed in number of molds of photons $[mol \, s^{-1} \, m^{-2} \, nm^{-1}]$.

Usage

```
as_quantum_mol(w.length, s.e.irrad)
```

Arguments

```
w. length numeric vector of wavelengths (nm).
```

s.e.irrad numeric vector of spectral (energy) irradiance values.

56 average_spct

Value

a numeric vector of spectral photon irradiances.

See Also

```
Other low-level functions operating on numeric vectors:: as_energy(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

Examples

```
with(sun.data, as_quantum_mol(w.length, s.e.irrad))
```

average_spct

Average spectral data.

Description

This function gives the result of integrating spectral data over wavelengths and dividing the result by the spread or span of the wavelengths.

Usage

```
average_spct(spct)
```

Arguments

spct

generic_spct

Value

One or more numeric values with no change in scale factor: e.g. [W m-2 nm-1] -> [W m-2 nm-1]. Each value in the returned vector corresponds to a variable in the spectral object, except for wavelength.

```
average_spct(sun.spct)
```

beesxyzCMF.spct 57

beesxyzCMF.spct

Honeybee xyz chromaticity colour matching function data

Description

A dataset containing wavelengths at a 5 nm interval (300 nm to 700 nm) and the corresponding x, y, and z chromaticity coordinates. Original data from XXX.

A chroma_spct object with variables as follows:

Usage

```
beesxyzCMF.spct
```

Format

A data frame with 81 rows and 4 variables

Details

- w.length (nm)
- x
- y
- z

See Also

black_body.spct

Theoretical optical bodies

Description

Datasets for a hypothetical objects with transmittance 0/1 (0%), reflectance 0/1 (0%), with transmittance 0/1 (0%), reflectance 1/1 (100%), and with with transmittance 1/1 (100%), reflectance 0/1 (0%).

Format

A object_spct object with 4 rows and 3 variables

58 c

Details

- w.length (nm)
- Tfr (0..1)
- Rfr (0..1)

С

Combine collections of spectra

Description

Combine two or more generic_mspct objects into a single object.

Usage

```
## S3 method for class 'generic_mspct'
c(..., recursive = FALSE, ncol = 1, byrow = FALSE)
```

Arguments

... one or more generic_mspct objects to combine.

recursive logical ignored as nesting of collections of spectra is not supported.

ncol numeric Virtual number of columns

byrow logical When object has two dimensions, how to map member objects to columns

and rows.

Value

A collection of spectra object belonging to the most derived class shared among the combined objects.

calc_multipliers 59

calc_multipliers

Spectral weights

Description

Calculate multipliers for selecting a range of wavelengths and optionally applying a biological spectral weighting function (BSWF) and wavelength normalization. This function returns numeric multipliers that can be used to select a waveband and apply a weight.

Usage

```
calc_multipliers(
  w.length,
  w.band,
  unit.out = "energy",
  unit.in = "energy",
  use.cached.mult = FALSE,
  fill = 0
)
```

Arguments

Value

a numeric vector of multipliers of the same length as w.length.

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

60 calc_source_output

Examples

```
with(sun.data, calc_multipliers(w.length, new_waveband(400,700),"photon"))
with(sun.data, calc_multipliers(w.length, new_waveband(400,700),"photon"), use.cached.mult = TRUE)
```

calc_source_output

Scaled and/or interpolated light-source spectral output

Description

Values calculated by interpolation from user-supplied spectral emission data or by name for light source data included in the packages photobiologySun, photobiologyLamps, or photobiologyLEDs, optionally re-scaling the spectral data values.

Usage

```
calc_source_output(
  w.length.out,
  w.length.in,
  s.irrad.in,
  unit.in = "energy",
  scaled = NULL,
  fill = NA,
  ...
)
```

Arguments

```
w.length.out numeric vector of wavelengths (nm) for output.
w.length.in numeric vector of wavelengths (nm) for input.
s.irrad.in numeric vector of spectral transmittance value (fractions or percent).
unit.in a character string "energy" or "photon".
scaled NULL, "peak", "area"; div ignored if !is.null(scaled).
fill if NA, no extrapolation is done, and NA is returned for wavelengths outside the range of the input. If NULL then the tails are deleted. If 0 then the tails are set to zero.
Additional arguments passed to spline if called.
```

Value

a source_spct with three numeric vectors with wavelength values (w.length), scaled and interpolated spectral energy irradiance (s.e.irrad), scaled and interpolated spectral photon irradiance values (s.q.irrad).

ccd.spct 61

Note

This is a convenience function that adds no new functionality but makes it a little easier to plot lamp spectral emission data consistently. It automates interpolation, extrapolation/trimming and scaling.

Examples

ccd.spct

Spectral response of a back-thinned CCD image sensor.

Description

A dataset containing wavelengths at a 1 nm interval and spectral response as quantum efficiency for CCD sensor type S11071/S10420 from Hamamatsu (measured without a quartz window). These vectors are frequently used as sensors in high-UV-sensitivity vector spectrometers. Data digitized from manufacturer's data sheet. The original data is expressed as percent quantum efficiency with a value of 77% at the peak. The data have been re-expressed as fractions of one.

Usage

ccd.spct

Format

A response_spct object with 186 rows and 2 variables

Details

- w.length (nm).
- s.q.response (fractional quantum efficiency)

References

Examples

ccd.spct

checkTimeUnit

Check the "time.unit" attribute of an existing source_spct object

Description

Function to read the "time.unit" attribute

Usage

checkTimeUnit(x)

Arguments

Х

a source_spct object

Value

x possibly with the time.unit attribute modified

Note

if x is not a source_spct or a response_spct object, NA is returned

See Also

 $Other time \ attribute \ functions: \ convert Thickness(), \ convert Time Unit(), get Time Unit(), set Time Unit(), get Tim$

check_spct

Check validity of spectral objects

Description

Check that an R object contains the expected data members and within range values in them. For wavelengths also check if ordered and if unique or not.

Usage

```
check_spct(x, byref, strict.range, force = FALSE, ...)
## Default S3 method:
check_spct(x, byref = FALSE, strict.range = NA, force = FALSE, ...)
## S3 method for class 'generic_spct'
check_spct(
 х,
 byref = TRUE,
 strict.range = NA,
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'calibration_spct'
check_spct(
 Х,
 byref = TRUE,
 strict.range = getOption("photobiology.strict.range", default = FALSE),
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'raw_spct'
check_spct(
 х,
 byref = TRUE,
 strict.range = getOption("photobiology.strict.range", default = FALSE),
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'cps_spct'
check_spct(
 х,
 byref = TRUE,
 strict.range = getOption("photobiology.strict.range", default = FALSE),
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'filter_spct'
check_spct(
```

```
Х,
 byref = TRUE,
 strict.range = getOption("photobiology.strict.range", default = FALSE),
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'solute_spct'
check_spct(
 х,
 byref = TRUE,
 strict.range = getOption("photobiology.strict.range", default = FALSE),
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'reflector_spct'
check_spct(
 Х,
 byref = TRUE,
 strict.range = getOption("photobiology.strict.range", default = FALSE),
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'object_spct'
check_spct(
 Χ,
 byref = TRUE,
 strict.range = getOption("photobiology.strict.range", default = FALSE),
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'response_spct'
check_spct(
 х,
 byref = TRUE,
 strict.range = NA,
 force = FALSE,
 multiple.wl = getMultipleWl(x),
)
```

```
## S3 method for class 'source_spct'
check_spct(
  х,
  byref = TRUE,
  strict.range = getOption("photobiology.strict.range", default = FALSE),
  force = FALSE,
 multiple.wl = getMultipleWl(x),
)
## S3 method for class 'chroma_spct'
check_spct(
  Х,
  byref = TRUE,
  strict.range = getOption("photobiology.strict.range", default = FALSE),
  force = FALSE,
 multiple.wl = getMultipleWl(x),
)
```

Arguments

x	An R object
byref	logical indicating if new object will be created by reference or by copy of x
strict.range	logical indicating whether off-range values result in an error instead of a warning, with NA a message is issued on failure.
force	logical If TRUE check is done even if checks are disabled.
	additional parameters possible in derived methods
multiple.wl	numeric Maximum number of repeated w.length entries with same value.

Details

These methods are exported and can be called by user code if needed, for example, when the checks have been disabled by setting an R option with disable_check_spct.

Methods (by class)

- check_spct(default): Default for generic function.
- check_spct(generic_spct): Specialization for generic_spct.
- check_spct(calibration_spct): Specialization for calibration_spct.
- check_spct(raw_spct): Specialization for raw_spct.
- check_spct(cps_spct): Specialization for cps_spct.
- check_spct(filter_spct): Specialization for filter_spct.
- check_spct(solute_spct): Specialization for solute_spct.
- check_spct(reflector_spct): Specialization for reflector_spct.

check_spectrum

- check_spct(object_spct): Specialization for object_spct.
- check_spct(response_spct): Specialization for response_spct.
- check_spct(source_spct): Specialization for source_spct.
- check_spct(chroma_spct): Specialization for chroma_spct.

See Also

Other data validity check functions: check_spectrum(), check_w.length(), enable_check_spct()

Examples

```
check_spct(sun.spct)
check_spct(sun.spct)
# try(check_spct(-sun.spct))
# try(check_spct((sun.spct[1, "w.length"] <- 1000)))</pre>
```

 ${\sf check_spectrum}$

Sanity check a spectrum

Description

Checks spectral irradiance data in numeric vectors for compliance with assumptions used in calculations.

Usage

```
check_spectrum(w.length, s.irrad)
```

Arguments

```
w.length numeric vector of wavelengths [nm].
s.irrad numeric Corresponding vector of spectral (energy) irradiances [W m^{-2} nm^{-1}].
```

Value

A single logical value indicating whether test was passed or not

See Also

```
Other data validity check functions: check_spct(), check_w.length(), enable_check_spct()
```

```
with(sun.data, check_spectrum(w.length, s.e.irrad))
```

check_w.length 67

check_w.length

Sanity check of wavelengths (internal function).

Description

This function checks a w.length vector for compliance with assumptions used in calculations.

Usage

```
check_w.length(w.length)
```

Arguments

w.length

numeric array of wavelength (nm)

Value

a single logical value indicating whether test was passed or not

See Also

Other data validity check functions: check_spct(), check_spctrum(), enable_check_spct()

Examples

```
with(sun.data, photobiology:::check_w.length(w.length))
```

ciev10.spct

Linear energy CIE 2008 luminous efficiency function 10 deg data

Description

A dataset containing wavelengths at a 1 nm interval (390 nm to 830 nm) and the corresponding response values for a 10 degrees target. Original data from http://www.cvrl.org/ downloaded on 2014-04-29 The variables are as follows:

- w.length (nm)
- s.e.response

Usage

```
ciev10.spct
```

Format

A chroma_spct object with 441 rows and 4 variables

class_spct 73

class_spct

Query which is the class of a spectrum

Description

Extract class information from a generic spectrum.

Usage

```
class_spct(x)
```

Arguments

Х

any R object

Details

The value returned is equivalent to the set intersection of the value returned by class(x) and the value returned by spct_classes, but preserving the order of the members of the character vector.

Value

A character vector containing all matching xxxx.spct S3 classes.

Examples

```
class_spct(sun.spct)
class(sun.spct)
```

clean

Clean (=replace) off-range values in a spectrum

Description

These functions implement the equivalent of replace() but for spectral objects instead of vectors.

```
clean(x, range, range.s.data, fill, ...)
## Default S3 method:
clean(x, range, range.s.data, fill, ...)
## S3 method for class 'source_spct'
clean(
```

```
Х,
  range = x,
 range.s.data = c(0, NA),
  fill = range.s.data,
 unit.out = getOption("photobiology.radiation.unit", default = "energy"),
)
## S3 method for class 'filter_spct'
clean(

  fill = range.s.data,
  unit.out = getOption("photobiology.radiation.unit", default = "energy"),
  .parallel = FALSE,
  .paropts = NULL
## S3 method for class 'cps_mspct'
clean(
 х,
  range = NULL,
  range.s.data = c(0, NA),
  fill = range.s.data,
  . . . ,
  .parallel = FALSE,
```

```
.paropts = NULL
)
## S3 method for class 'raw_mspct'
clean(
 Х,
 range = NULL,
 range.s.data = c(0, NA),
 fill = range.s.data,
  .parallel = FALSE,
 .paropts = NULL
## S3 method for class 'generic_mspct'
clean(
 Х,
 range = x,
 range.s.data = c(NA_real_, NA_real_),
 fill = range.s.data,
 col.names,
  ...,
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

x	an R object
range	numeric vector of wavelengths
range.s.data	numeric vector of length two giving the allowable range for the spectral data.
fill	numeric vector of length 1 or 2, giving the replacement values to use at each extreme of the range.
	currently ignored
unit.out	character string with allowed values "energy", and "photon", or its alias "quantum"
qty.out	character string with allowed values "energy", and "photon", or its alias "quantum"
min.Afr	numeric Gives the minimum value accepted for the computed absorptance. The default NULL sets a valid value (Afr ≥ 0) with a warning. If an integer value is passed to digits values are adjusted silently.
col.names	character The name of the variable to clean
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

78 clear.spct

Value

A copy of x, possibly with some of the spectral data values replaced by the value passed to fill.

Methods (by class)

- clean(default): Default for generic function
- clean(source_spct): Replace off-range values in a source spectrum
- clean(filter_spct): Replace off-range values in a filter spectrum
- clean(reflector_spct): Replace off-range values in a reflector spectrum
- clean(solute_spct): Replace off-range values in a solute spectrum
- clean(object_spct): Replace off-range values in an object spectrum
- clean(response_spct): Replace off-range values in a response spectrum
- clean(cps_spct): Replace off-range values in a counts per second spectrum
- clean(raw_spct): Replace off-range values in a raw counts spectrum
- clean(generic_spct): Replace off-range values in a generic spectrum
- clean(source_mspct):
- clean(filter_mspct):
- clean(reflector_mspct):
- clean(object_mspct):
- clean(solute_mspct):
- clean(response_mspct):
- clean(cps_mspct):
- clean(raw_mspct):
- clean(generic_mspct):

Note

In the case of object_spct objects, cleaning is done first on the Rfr and Tfr columns and sub-sequently Afr estimated and if needed half of deviation of Afr from the expected minimum value subtracted from each of Rfr and Tfr.

clear.spct

Theoretical spectrum of clear and apaque materials

Description

Dataset for hypothetical objects with transmittance 1/1 (100%) and transmittance 0/1 (0%)

```
clear.spct
opaque.spct
```

clip_wl 79

Format

A filter_spct object with 4 rows and 2 variables

An object of class filter_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 4 rows and 2 columns.

Details

- w.length (nm).
- Tfr (0..1)

See Also

Other Spectral data examples: A.illuminant.spct, D50.illuminant.spct, D65.illuminant.spct, Ler_leaf.spct, black_body.spct, ccd.spct, filter_cps.mspct, green_leaf.spct, phenylalanine.spct, photodiode.spct, sun.spct, sun_daily.spct, sun_evening.spct, two_filters.spct, two_sensors.mspct, water.spct, white_led.source_spct

Examples

```
clear.spct
opaque.spct
```

clip_wl

Clip head and/or tail of a spectrum

Description

Clip head and tail of a spectrum based on wavelength limits, no interpolation used at range boundaries.

```
clip_wl(x, range, ...)
## Default S3 method:
clip_wl(x, range, ...)
## S3 method for class 'generic_spct'
clip_wl(x, range = NULL, ...)
## S3 method for class 'generic_mspct'
clip_wl(x, range = NULL, ...)
## S3 method for class 'waveband'
clip_wl(x, range = NULL, ...)
```

80 clip_wl

```
## S3 method for class 'list'
clip_wl(x, range = NULL, ...)
```

Arguments

x an R object.

range a numeric vector of length two, or any other object for which function range()

will return range of wavelengths expressed in nanometres.

... ignored (possibly used by derived methods).

Value

a spectrum object or a collection of spectral objects of the same class as x with wavelength heads and tails clipped.

Methods (by class)

- clip_wl(default): Default for generic function
- clip_wl(generic_spct): Clip an object of class "generic_spct" or derived.
- clip_wl(generic_mspct): Clip an object of class "generic_mspct" or derived.
- clip_wl(waveband): Clip an object of class "waveband".
- clip_wl(list): Clip a list (of objects of class "waveband").

Note

The condition tested is $wl \ge range[1] \& wl < (range[2] + 1e-13)$.

See Also

Examples

```
clip_wl(sun.spct, range = c(400, 500))
clip_wl(sun.spct, range = c(NA, 500))
clip_wl(sun.spct, range = c(400, NA))
```

collect2mspct 81

collect2mspct

Form a new collection

Description

Form a collection of spectra from separate objects in the parent frame of the call.

Usage

```
collect2mspct(
   .list = NULL,
   pattern = "*\\.spct$",
   collection.class = NULL,
   ...
)
```

Arguments

Details

This is a convenience function that simplifies the creation of collections from existing objects of class generic_spct or a derived class. A list of objects con be passed as argument, or a search pattern. If a list is passed, no search is done. If collection.class is NULL, then all objects of class generic_spct or of a class derived from it are added to the collection. If objects of only one derived class are to be collected this class or that of the matching collection should be passed as argument to collection.class. Objects of other R classes are silently discarded, which simplifies the specification of search patterns. By default, i.e., if collection.class is NULL, if all the objects collected belong to the same class then the corresponding collection class will be returned, otherwise a generic_mspct object with heterogeneous members will be returned. To force the return of a generic_mspct even when the collected spectra all belong to the same class, pass generic_mspct as argument to collection.class. If the argument to collection.class is a vector containing two of more class names, only the matching spectra will be collected, and a generic_mspct will be returned. The returned object is created with the constructor for the class, and validated.

Value

By default a collection of spectra.

82 color_of

See Also

Other experimental utility functions: drop_user_cols(), thin_wl(), uncollect2spct()

Examples

```
collect2mspct() # returns empty generic_mspct object
sun1.spct <- sun.spct
sun2.spct <- sun.spct
kk.spct <- 10:30 # ignored
collect2mspct()
collect2mspct(collection.class = "generic_mspct")

pet1.spct <- polyester.spct
collect2mspct()
collect2mspct(collection.class = "source_mspct")
collect2mspct(collection.class = "filter_mspct")
collect2mspct(collection.class = "response_mspct")</pre>
```

color_of

Color of an object

Description

Equivalent RGB color of an object such as a spectrum, wavelength or waveband.

```
color_of(x, ...)
## Default S3 method:
color_of(x, ...)
## S3 method for class 'numeric'
color_of(x, type = "CMF", chroma.type = type, ...)
## S3 method for class 'list'
color_of(x, short.names = TRUE, type = "CMF", chroma.type = type, ...)
## S3 method for class 'waveband'
color_of(x, short.names = TRUE, type = "CMF", chroma.type = type, ...)
## S3 method for class 'source_spct'
color_of(x, type = "CMF", chroma.type = type, ...)
## S3 method for class 'source_mspct'
color_of(x, ..., idx = "spct.idx")
```

color_of

```
colour_of(x, ...)
color(x, ...)
fast_color_of_wl(x, type = "CMF", ...)
fast_color_of_wb(x, type = "CMF", ...)
```

Arguments

```
    x an R object.
    ... ignored (possibly used by derived methods).
    type, chroma.type

            character telling whether "CMF", "CC", or "both" should be returned for human vision, or an object of class chroma_spct for any other trichromic visual system.

    short.names logical indicating whether to use short or long names for wavebands
    idx character Name of the column with the names of the members of the collection of spectra.
```

Value

A color definition in hexadecimal format as a character string of 7 characters, "#" followed by the red, blue, and green values in hexadecimal (scaled to 0 ... 255). In the case of the specialization for list, a list of such definitions is returned. In the case of a collection of spectra, a data.frame with one column with such definitions and by default an additional column with names of the spectra as index. In case of missing input the returned value is NA.

Methods (by class)

- color_of(default): Default method (returns always "black").
- color_of(numeric): Method that returns Color definitions corresponding to numeric values representing a wavelengths in nm.
- color_of(list): Method that returns Color of elements in a list.
- color_of(waveband): Color at midpoint of a waveband object.
- color_of(source_spct):
- color_of(source_mspct):

Deprecated

Use of color() is deprecated as this wrapper function may be removed in future versions of the package because of name clashes. Use color_of() instead.

84 compare_spct

Note

The specialization of color_of() for numeric and function fast_color_of_wl() accept both positive and negative values in x as long as all values have the same sign. This makes its use in 'ggspectra' simpler as the reverse scale transform changes the sign of the data. This should be considered a temporary fix.

When x is a list but not a waveband, if a method color_of is not available for the class of each element of the list, then color_of.default will be called.

Function fast_color_of_wl() should be used only when high performance is needed. It speeds up performance by rounding the wavelength values in the numeric vector passed as argument to x and then retrieves the corresponding pre-computed color definitions if type is either "CMF" or "CC". In other cases it falls-back to calling color_of.numeric(). Returned color definitions always have default names irrespective of names of x, which is different from the behavior of color_of() methods.

Function fast_color_of_wb() accepts waveband objects and lists of waveband objects. If all wavebands are narrow, it issues a vectotized call to fast_color_of_wl() with a vector of waveband midpoint wavelengths.

Examples

```
wavelengths <- c(300, 420, 500, 600, NA) # nanometres
color_of(wavelengths)
color_of(waveband(c(300,400)))
color_of(list(blue = waveband(c(400,480)), red = waveband(c(600,700))))
color_of(numeric())
color_of(NA_real_)
color_of(sun.spct)</pre>
```

compare_spct

Coarse-grained comparison of two spectra

Description

Compare two spectra using a specified summary function pre-applied to wavelength intervals.

```
compare_spct(
    x,
    w.band = 10,
    .summary.fun = NULL,
    ...,
    .comparison.fun = `/`,
    returned.value = "spectrum",
    use.hinges = FALSE,
    short.names = TRUE
)
```

compare_spct 85

Arguments

X	A collection of two spectral objects of the same type.	
w.band	waveband object or a numeric stepsize in nanometres.	
.summary.fun	function. The summary function to use. It must be a method accepting object \boldsymbol{x} as first argument.	
• • •	additional named arguments passed down to .summary.fun.	
.comparison.fun		
	function. The comparison function to use.	
returned.value	character One of "data.frame", "spectrum", "tagged.spectrum".	
use.hinges	logical Flag indicating whether to insert "hinges" into the returned spectrum when tagging it.	
short.names	logical Flag indicating whether to use short or long names for wavebands when tagging.	

Details

Summaries are computed for each of the wavebands in w.band by applying function .summary.fun separately to each spectrum, after trimming them to the overlapping wavelength region. Next the matching summaries are compared by means of .comparison.fun. Both the summaries and the result of the comparison are returned. Columns containing summary values are named by concatenating the name each member spectrum with the name of the argument passed to .summary.fun.

Tagging is useful for plotting using wavelength based colours, or when names for wavebands are used as annotations. When tagging is requested, the spectrum is passed to method tag with use.hinges and short.names as additional arguments.

Value

A generic_spct, tagged or not with the wavebdans, or a data. frame object containing the summary values per waveband for each spectrum and the result of applying the comparison function to these summaries.

Examples

cone_fundamentals10.spct

Ten-degree cone fundamentals

Description

A dataset containing wavelengths at a 1 nm interval (390 nm to 830 nm) and the corresponding response values for a 2 degrees target. Original data from http://www.cvrl.org/downloaded on 2014-04-29 The variables are as follows:

Usage

```
cone_fundamentals10.spct
cone_fundamentals10.mspct
```

Format

A chroma_spct object with 440 rows and 4 variables

An object of class response_mspct (inherits from generic_mspct, list) with 3 rows and 1 columns.

Details

- w.length (nm)
- x
- y
- z

Value

A chroma_spct object.

A response_mspct object containing the same data in three response_spct objects, one for each of x, y and z.

Note

These data are not from the official CIE on-line distribution but are retained for backwards compatibility. It is recommended to download the latest version from https://cie.co.at/data-tables. The missing data for z in the NIR have been filled with zeros.

convertTfrType 87

Author(s)

CIE

See Also

Examples

cone_fundamentals10.spct

convertTfrType

Convert the "Tfr.type" attribute

Description

Function to set the "Tfr.type" attribute and simultaneously convert the spectral data to correspond to the new type.

Usage

```
convertTfrType(x, Tfr.type = NULL)
```

Arguments

x a filter_spct, object_spct, filter_mspct or object_mspct object.

Tfr.type character One of "internal" or "total".

Details

Internal transmittance, τ , uses as reference the light entering the object while total transmittance, T, takes the incident light as reference. The conversion is possible only if total reflectance, ρ , is known. Either as spectral data in an object_spct object, a filter_spct object that is "under-the-hood" an object_spct, or if a fixed reflectance factor applicable to all wavelengths is stored in the filter_spct object.

Conversions are computed as:

$$\tau = \frac{T - \rho}{1 - \rho}$$

and

$$T = \tau * (1 - \rho) + \rho$$

For the conversion to take place the object passed as argument to x, must contain a column with transmittance data, named Tfr. Any necessary conversion from absorbance A or from Afr into transmittance, must be done before calling convertTfrType().

88 convertThickness

Value

x if possible, with the value of the "Tfr. type" attribute modified and the values stored in the Tfr variable converted to the new quantity.

Note

if x is not a filter_spct object, x is returned unchanged. If x does not have the "filter.properties" attribute set if it is missing data, x is returned with Tfr set to NA values.

See Also

```
setTfrType, filter_spct
```

Examples

```
getTfrType(polyester.spct)
filter_properties(polyester.spct)
convertTfrType(polyester.spct, Tfr.type = "internal")
```

convertThickness

Convert the "thickness" attribute of an existing filter_spct object.

Description

Function to set the "thickness" attribute and simultaneously converting the spectral data to correspond to the new thickness.

Usage

```
convertThickness(x, thickness = NULL)
```

Arguments

```
x a filter_spct, object_spct, filter_mspct or object_mspct object.
thickness numeric [m].
```

Details

For spectral transmittance at a different thickness to be exactly computed, it needs to be based on internal transmittance. This function will apply converTfrType() to x if needed, but to succeed metadata should be available. Please, see convertTfrType.

Value

x possibly with the "thickness" field of the "filter.properties" attribute modified and Tfr or A computed for the requested thickness.

convertTimeUnit 89

Note

if x is not a filter_spct, object_spct, filter_mspct or object_mspct object or a collection of such objects, x is returned unchanged. If x does not have the "filter.properties" attribute set or has it with missing member data, x is returned with Tfr set to NA values.

See Also

Other time attribute functions: checkTimeUnit(), convertTimeUnit(), getTimeUnit(), setTimeUnit()

Examples

```
my.spct <- polyester.spct
filter_properties(my.spct)
convertThickness(my.spct, thickness = 250e-6)</pre>
```

convertTimeUnit

Convert the "time.unit" attribute of an existing source_spct object

Description

Function to set the "time.unit" attribute and simultaneously rescaling the spectral data to be expressed using the new time unit as basis of expression. The change is done by reference ('in place').

Usage

```
convertTimeUnit(x, time.unit = NULL, ...)
```

Arguments

```
x source_spct or response_spct object
time.unit a character string, either "second", "hour", "day", "exposure" or "none", or a lubridate::duration
... (currently ignored)
```

Value

x possibly with the time.unit attribute modified

Note

if x is not a source_spct or a response_spct object, or time.unit is NULL x is returned unchanged, if the existing or new time.unit cannot be converted to a duration, then the returned spectrum will contain NAs.

See Also

Other time attribute functions: checkTimeUnit(), convertThickness(), getTimeUnit(), setTimeUnit()

90 convolve_each

Examples

```
my.spct <- sun.spct
my.spct
convertTimeUnit(my.spct, "day")
my.spct</pre>
```

convolve_each

Convolve function for collections of spectra

Description

Convolve function for collections of spectra which applies an operation on all the individual members of the collection(s) of spectra.

Usage

```
convolve_each(e1, e2, oper = `*`, sep = "_", ...)
```

Arguments

e1	an object of class generic_mspct or generic_scpt or numeric
e2	an object of class generic_mspct or generic_scpt or numeric
oper	function, usually but not necessarily an operator with two arguments.
sep	character Used when pasting the names of members of e1 and e2 to form the names of members of the returned collection of spectra.
	additional arguments passed to oper if present.

Note

At least one of e1 and e2 must be a generic_mspct object or derived.

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), div-.generic_spct, log(), minus-.generic_spct, mod-.generic_spct, plus-.generic_spct, round(), sign(), slash-.generic_spct, times-.generic_spct
```

copy_attributes 91

copy_attributes C

Copy attributes

Description

Copy attributes from x to y. Methods defined for spectral and waveband objects of classes from package 'photobiology'.

Usage

```
copy_attributes(x, y, which, ...)

## Default S3 method:
copy_attributes(x, y, which = NULL, ...)

## S3 method for class 'generic_spct'
copy_attributes(x, y, which = NULL, which.not = NULL, copy.class = FALSE, ...)

## S3 method for class 'generic_mspct'
copy_attributes(x, y, which = NULL, which.not = NULL, copy.class = FALSE, ...)

## S3 method for class 'waveband'
copy_attributes(x, y, which = NULL, ...)
```

Arguments

x, y	R objects
which	character Names of attributes to copy, if NULL all those relevant according to the class of x is used as defaul,
	not used
which.not	character Names of attributes not to be copied. The names passed here are removed from the list for which, which is most useful when we want to modify the default.
copy.class	logical If TRUE class attributes are also copied.

Value

A copy of y with additional attributes set.

Methods (by class)

- copy_attributes(default): Default for generic function
- copy_attributes(generic_spct):
- copy_attributes(generic_mspct):
- copy_attributes(waveband):

92 cps2irrad

	·	
cps2	ΤĽ	rau

Conversion from counts per second to physical quantities

Description

Conversion of spectral data expressed as cps into irradiance, transmittance or reflectance.

Usage

```
cps2irrad(x.sample, pre.fun = NULL, missing.pixs = numeric(0), ...)
cps2Rfr(x.sample, x.white, x.black = NULL, dyn.range = NULL)
cps2Tfr(x.sample, x.clear, x.opaque = NULL, dyn.range = NULL)
```

Arguments

```
    x.sample, x.clear, x.opaque, x.white, x.black cps_spct objects.
    pre.fun function A function applied to x.sample before conversion.
    missing.pixs integer Index to positions in the detector array or scan missing in x.sample but present in the embedded calibration data. (Use only for emergency recovery of incomplete data!!)
    ... Additional arguments passed to pre.fun.
    dyn.range numeric The effective dynamic range of the instrument, if NULL it is automatically set based on integration time bracketing.
```

Value

A source_spct, filter_spct or reflector_spct object containing the spectral values expressed in physical units.

Note

In contrast to other classes defined in package 'photobiology', class "cps_spct" can have more than one column of cps counts in cases where the intention is to merge these values as part of the processing at the time the calibration is applied. However, being these functions the final step in the conversion to physical units, they accept as input only objects with a single "cps" column, as merging is expected to have been already done.

D2.UV653

D2.UV653

Data for typical calibration lamps

Description

A dataset containing fitted constants to be used as input for functions D2_spectrum and FEL_spectrum for computing example spectral curves based on fitted polynomials.

Format

A polynom::polynomial object with 6 constants.

Details

An object of class polynom::polynomial.

Author(s)

Lasse Ylianttila (data)

Examples

```
D2.UV653 as.character(D2.UV653)
```

D2_spectrum

Calculate deuterium lamp output spectrum from fitted constants

Description

Calculate values by means of a nth degree polynomial from user-supplied constants (for example from a lamp calibration certificate).

Usage

```
D2_spectrum(w.length, k = photobiology::D2.UV653, fill = NA_real_)
```

Arguments

w.length numeric vector of wavelengths (nm) for output

k a polynomial object with n constants for the polynomial

fill if NA, no extrapolation is done, and NA is returned for wavelengths outside the

range 190 nm to 450 nm. If NULL then the tails are deleted. If 0 then the tails

are set to zero, etc. NA is default.

94 D50.illuminant.spct

Value

a dataframe with four numeric vectors with wavelength values (w.length), energy and photon irradiance (s.e.irrad, s.q.irrad) depending on the argument passed to unit.out (s.irrad).

Note

This is function is valid for wavelengths in the range 180 nm to 495 nm, for wavelengths outside this range NAs are returned.

Examples

```
D2_spectrum(200)
D2_spectrum(170:220)
```

D50.illuminant.spct

CIE D50 illuminant data

Description

A dataset containing wavelengths at a 5 nm interval (300 nm to 830 nm) and the corresponding spectral energy irradiance normalized to 1 at 560 nm. Spectrum approximates the midday solar spectrum at middle latitude as 'corresponds' to the white point of a black body a 6504 K. Original data from CIE downloaded on 2024-11-30 The variables are as follows:

Usage

```
D50.illuminant.spct
```

Format

A source spectrum with 531 rows and 2 variables

- w.length (nm)
- s.e.irrad (rel. units)

Note

This and other CIE illuminant spectra can be downloaded from https://cie.co.at/data-tables as .CSV files.

```

despike

Remove spikes from spectrum

Description

Function that returns an R object with observations corresponding to spikes replaced by values computed from neighboring pixels. Spikes are values in spectra that are unusually high compared to neighbors. They are usually individual values or very short runs of similar "unusual" values. Spikes caused by cosmic radiation are a frequent problem in Raman spectra. Another source of spikes are "hot pixels" in CCD and diode array detectors.

```

  .parallel = FALSE,
  .paropts = NULL
## S3 method for class 'raw_mspct'
despike(
  Х,
 z.threshold = 9,
 max.spike.width = 8,
 window.width = 11,
 method = "run.mean",
 na.rm = FALSE,
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

an R object z.threshold numeric Modified Z values larger than z. threshold are considered to correspond to spikes. max.spike.width integer Wider regions with high Z values are not detected as spikes. integer. The full width of the window used for the running mean used as rewindow.width placement. method character The name of the method: "run.mean" is running mean as described in Whitaker and Hayes (2018); "adj.mean" is mean of adjacent neighbors (isolated bad pixels only). logical indicating whether NA values should be treated as spikes and replaced. na.rm Arguments passed by name to find_spikes(). var.name, y.var.name character Names of columns where to look for spikes to remove. character One of "energy" or "photon" unit.out filter.qty character One of "transmittance" or "absorbance" if TRUE, apply function in parallel, using parallel backend provided by foreach .parallel

.paropts

a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

Spikes are detected based on a modified Z score calculated from the differenced spectrum. The Z threshold used should be adjusted to the characteristics of the input and desired sensitivity. The lower the threshold the more stringent the test becomes, resulting in most cases in more spikes being detected. A modified version of the algorithm is used if a value different from NULL is passed as argument to max.spike.width. In such a case, an additional step filters out broader spikes (or falsely detected steep slopes) from the returned values.

Simple interpolation replaces values of isolated bad pixels by the mean of their two closest neighbors. The running mean approach allows the replacement of short runs of bad pixels by the running mean of neighboring pixels within a window of user-specified width. The first approach works well for spectra from array spectrometers to correct for hot and dead pixels in an instrument. The second approach is most suitable for Raman spectra in which spikes triggered by radiation are wider than a single pixel but usually not more than five pixels wide.

When the argument passed to x contains multiple spectra, the spikes are searched for and replaced in each spectrum independently of other spectra.

Value

A copy of the object passed as argument to x with values detected as spikes replaced by a local average of adjacent neighbors outside the spike.

Methods (by class)

- despike(default): Default returning always NA.
- despike(numeric): Default function usable on numeric vectors.
- despike(data.frame): Method for "data.frame" objects.
- despike(generic_spct): Method for "generic_spct" objects.
- despike(source_spct): Method for "source_spct" objects.
- despike(response_spct): Method for "response_spct" objects.
- despike(filter_spct): Method for "filter_spct" objects.
- despike(reflector_spct): Method for "reflector_spct" objects.
- despike(solute_spct): Method for "solute_spct" objects.
- despike(cps_spct): Method for "cps_spct" objects.
- despike(raw_spct): Method for "raw_spct" objects.
- despike(generic_mspct): Method for "generic_mspct" objects.
- despike(source_mspct): Method for "source_mspct" objects.
- despike(response_mspct): Method for "cps_mspct" objects.
- despike(filter_mspct): Method for "filter_mspct" objects.

- despike(reflector_mspct): Method for "reflector_mspct" objects.
- despike(solute_mspct): Method for "solute_mspct" objects.
- despike(cps_mspct): Method for "cps_mspct" objects.
- despike(raw_mspct): Method for "raw_mspct" objects.

Note

Current algorithm misidentifies steep smooth slopes as spikes, so manual inspection is needed together with adjustment by trial and error of a suitable argument value for z.threshold.

See Also

See the documentation for find_spikes and replace_bad_pixs for details of the algorithm and implementation.

Examples

```
\begin{tabular}{ll} diffraction\_single\_slit\\ Diffraction \end{tabular}
```

Description

Diffraction of optical radiation passing through a single slit can be computed with function diffraction_single_slit(), which implements Fraunhofer's equation. Diffraction plus interference for a pair of slits can be computed with diffraction_double_slit().

Usage

```
diffraction_single_slit(w.length, slit.width, angle)
diffraction_double_slit(w.length, slit.width, slit.distance, angle)
```

Arguments

```
    w.length numeric Wavelength (nm).
    slit.width numeric Width of the slit (m).
    angle numeric vector Angle (radians).
    slit.distance numeric Distance between the centres of the two slits (m).
```

dim.generic_mspct 105

Value

A numeric vector of the same length as angle, containing relative intensities.

Examples

```
diffraction_single_slit(w.length = 550,
                             slit.width = 1e-5,
                             angle = 0)
# use odd number for length.out so that 0 is in the sequence
angles \leftarrow pi * seq(from = -1/2, to = 1/2, length.out = 501)
plot(angles,
     diffraction_single_slit(w.length = 550, # 550 nm
                             slit.width = 6e-6, # 6 um
                             angle = angles),
     type = "1",
     ylab = "Relative irradiance (/1)",
     xlab = "Angle (radian)")
plot(angles,
     diffraction_double_slit(w.length = 550, # 550 nm
                             slit.width = 6e-6, # 6 um
                             slit.distance = 18e-6, # 18 um
                             angle = angles),
     type = "1",
     ylab = "Relative irradiance (/1)",
     xlab = "Angle (radian)")
```

dim.generic_mspct

Dimensions of an Object

Description

Retrieve or set the dimension of an object.

Usage

```
## S3 method for class 'generic_mspct'
dim(x)
## S3 replacement method for class 'generic_mspct'
dim(x) <- value</pre>
```

Arguments

x A generic_mspct object or of a derived class.

value Either NULL or a numeric vector, which is coerced to integer (by truncation).

106 div_spectra

Value

Either NULL or a numeric vector, which is coerced to integer (by truncation).

```
div-.generic_spct Arithmetic Operators
```

Description

Integer-division operator for generic spectra.

Usage

```
## S3 method for class 'generic_spct'
e1 %/% e2
```

Arguments

```
e1 an object of class "generic_spct"
e2 an object of class "generic_spct"
```

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), convolve_each(), log(), minus-.generic_spct, mod-.generic_spct, plus-.generic_spct, round(), sign(), slash-.generic_spct, times-.generic_spct
```

div_spectra

Divide two spectra, even if the wavelengths values differ

Description

The wavelength vectors of the two spectra are merged, and the missing spectral values are calculated by interpolation. After this, the two spectral values at each wavelength are operated upon.

```
div_spectra(
  w.length1,
  w.length2 = NULL,
  s.irrad1,
  s.irrad2,
  trim = "union",
  na.rm = FALSE
)
```

div_spectra 107

Arguments

w.length1	numeric vector of wavelength (nm) of denominator.
w.length2	numeric vector of wavelength (nm) of divisor.
s.irrad1	a numeric vector of spectral values of denominator.
s.irrad2	a numeric vector of spectral values of divisor.
trim	a character string with value "union" or "intersection".
na.rm	a logical value, if TRUE, not the default, NAs in the input are replaced with zeros.

Details

If trim=="union" spectral values are calculated for the whole range of wavelengths covered by at least one of the input spectra, and missing values are set in each input spectrum to zero before addition. If trim=="intersection" then the range of wavelengths covered by both input spectra is returned, and the non-overlapping regions discarded. If w.length2==NULL, it is assumed that both spectra are measured at the same wavelengths, and a simple addition is used, ensuring fast calculation.

Value

a dataframe with two numeric variables.

w.length	A numeric vector with the wavelengths (nm) obtained by "fusing" w.length1 and w.length2. w.length contains all the unique vales, sorted in ascending order.
s.irrad	A numeric vector with the ratio between the two spectral values at each wavelength.

```

Examples

```
head(sun.data)
one.data <- with(sun.data, div_spectra(w.length, w.length, s.e.irrad, s.e.irrad))
head(one.data)
tail(one.data)</pre>
```

108 drop_user_cols

drop_user_cols

Drop user columns

Description

Remove from spectral object additional columns that are user defined.

```
drop_user_cols(x, keep.also, ...)
## Default S3 method:
drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'generic_spct'
drop_user_cols(x, keep.also, ...)
## S3 method for class 'source_spct'
drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'response_spct'
drop_user_cols(x, keep.also = NULL, ...)

drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'filter_spct'
drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'reflector_spct'
drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'solute_spct'
drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'chroma_spct'
drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'calibration_spct'
drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'cps_spct'
drop_user_cols(x, keep.also = NULL, ...)
## S3 method for class 'raw_spct'
drop_user_cols(x, keep.also = NULL, ...)
```

e2q

```
## S3 method for class 'generic_mspct'
drop_user_cols(x, keep.also = NULL, ...)
```

Arguments

```
x An R objectkeep.also character Additional columns to preserve.... needed to allow derivation.
```

Value

A copy of x possibly with some columns removed.

Methods (by class)

```
• drop_user_cols(default):
```

- drop_user_cols(generic_spct):
- drop_user_cols(source_spct):
- drop_user_cols(response_spct):
- drop_user_cols(object_spct):
- drop_user_cols(filter_spct):
- drop_user_cols(reflector_spct):
- drop_user_cols(solute_spct):
- drop_user_cols(chroma_spct):
- drop_user_cols(calibration_spct):
- drop_user_cols(cps_spct):
- drop_user_cols(raw_spct):
- drop_user_cols(generic_mspct):

See Also

Other experimental utility functions: collect2mspct(), thin_wl(), uncollect2spct()

e2q

Convert energy-based quantities into photon-based quantities.

Description

Conversion methods for spectral energy irradiance into spectral photon irradiance and for spectral energy response into spectral photon response.

110 e2q

Usage

```
e2q(x, action, byref, ...)
## Default S3 method:
e2q(x, action = "add", byref = FALSE, ...)

## S3 method for class 'source_spct'
e2q(x, action = NULL, byref = FALSE, ...)

## S3 method for class 'response_spct'
e2q(x, action = "add", byref = FALSE, ...)

## S3 method for class 'source_mspct'
e2q(x, action = "add", byref = FALSE, ..., .parallel = FALSE, .paropts = NULL)

## S3 method for class 'response_mspct'
e2q(x, action = "add", byref = FALSE, ..., .parallel = FALSE, .paropts = NULL)
```

Arguments

x	an R object.
action	a character string, one of "add", or "replace".
byref	logical indicating if a new object will be created by reference or a new object returned.
	not used in current version.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

The converted spectral values are added to or replace the existing spectral values depending on the argument passed to parameter action. Addition is currently not supported for normalized spectra. If the spectrum has been normalized with a recent version of package 'photobiology' the spectrum will be renormalized after conversion using the same arguments as previously.

Methods (by class)

- e2q(default): Default method
- e2q(source_spct): Method for spectral irradiance
- e2q(response_spct): Method for spectral responsiveness
- e2q(source_mspct): Method for collections of (light) source spectra
- e2q(response_mspct): Method for collections of response spectra

e2qmol_multipliers 111

See Also

```
Other quantity conversion functions: A2T(), Afr2T(), T2A(), T2Afr(), any2T(), as_quantum(), e2qmol_multipliers(), e2quantum_multipliers(), q2e()
```

e2qmol_multipliers

Calculate energy to quantum (mol) multipliers

Description

Multipliers as a function of wavelength, for converting from energy to photon (quantum) molar units.

Usage

```
e2qmol_multipliers(w.length)
```

Arguments

w.length

numeric Vector of wavelengths (nm)

Value

A numeric vector of multipliers

See Also

```
Other quantity conversion functions: A2T(), Afr2T(), T2A(), T2Afr(), any2T(), as_quantum(), e2q(), e2quantum_multipliers(), q2e()
```

Examples

```
with(sun.data, e2qmol_multipliers(w.length))
```

e2quantum_multipliers Calculate energy to quantum multipliers

Description

Gives multipliers as a function of wavelength, for converting from energy to photon (quantum) units (number of photons as default, or moles of photons).

```
e2quantum_multipliers(w.length, molar = FALSE)
```

112 enable_check_spct

Arguments

w.length numeric Vector of wavelengths (nm)

molar logical Flag indicating whether output should be in moles or numbers

Value

A numeric vector of multipliers

See Also

```
Other quantity conversion functions: A2T(), Afr2T(), T2A(), T2Afr(), any2T(), as_quantum(), e2q(), e2qmol_multipliers(), q2e()
```

Examples

```
with(sun.data, e2quantum_multipliers(w.length))
with(sun.data, e2quantum_multipliers(w.length, molar = TRUE))
```

enable_check_spct

Enable or disable checks

Description

Choose between protection against errors or faster performance by enabling (the default) or disabling data-consistency and sanity checks.

Usage

```
enable_check_spct()
disable_check_spct()
set_check_spct(x)
```

Arguments

Х

logical Flag to enable (TRUE), disable (FALSE) or unset (NULL) option.

Details

Checks are applied by default after each operation that modifies the data. This can be excessive in production code. Some functions within this package disable checks for partial computations and apply them to the value they return. It is possible for users to apply this same approach, in which case it is best to schedule the restore of the previous setting using 'on.exit()'.

energy_as_default 113

Value

The previous value of the option, which can be passed as argument to function set_check_spct() to restore the previous state of the option.

See Also

```
[check_spct()]
Other data validity check functions: check_spct(), check_spectrum(), check_w.length()
```

energy_as_default

Set spectral-data options

Description

Set spectral-data related options easily.

Usage

```
energy_as_default()
photon_as_default()
quantum_as_default()

Tfr_as_default()

Afr_as_default()

A_as_default()

unset_radiation_unit_default()

unset_filter_qty_default()

unset_user_defaults()
```

Value

Previous value of the modified option.

114 energy_irradiance

energy_irradiance

Calculate (energy) irradiance from spectral irradiance

Description

Energy irradiance for a waveband from a radiation spectrum, optionally applying a "biological spectral weighting function" or BSWF.

Usage

```
energy_irradiance(
   w.length,
   s.irrad,
   w.band = NULL,
   unit.in = "energy",
   check.spectrum = TRUE,
   use.cached.mult = FALSE,
   use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

Arguments

w.length	numeric vector of wavelength $[nm]$.
s.irrad	numeric vector of spectral irradiances in $[Wm^{-2}nm^{-1}]$ or $[mols^{-1}sm^{-2}nm^{-1}]$ as indicated by the argument pased to unit.in.
w.band	waveband.
unit.in	character Allowed values "energy", and "photon", or its alias "quantum".
check.spectrum	logical Flag indicating whether to sanity check input data, default is TRUE.
use.cached.mul	t
	logical Flag indicating whether multiplier values should be cached between calls.
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.

Value

A single numeric value with no change in scale factor: $[W m^{-2}]$.

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

energy_ratio 115

Examples

```
with(sun.data, energy_irradiance(w.length, s.e.irrad))
with(sun.data, energy_irradiance(w.length, s.e.irrad, new_waveband(400,700)))
```

energy_ratio

Energy:energy ratio

Description

Energy irradiance ratio between two wavebands for a radiation spectrum.

Usage

```
energy_ratio(
  w.length,
  s.irrad,
  w.band.num = NULL,
  w.band.denom = NULL,
  unit.in = "energy",
  check.spectrum = TRUE,
  use.cached.mult = FALSE,
  use.hinges = NULL
)
```

Arguments

w.length	numeric vector of wavelengths $[nm]$.	
s.irrad	numeric vector of spectral irradiances in [$Wm^{-2}nm^{-1}$] or [$mols^{-1}sm^{-2}nm^{-1}$] as indicated by the argument pased to unit.in.	
w.band.num	waveband object used to compute the numerator of the ratio.	
w.band.denom	waveband object used to compute the denominator of the ratio.	
unit.in	character Allowed values "energy", and "photon", or its alias "quantum".	
${\tt check.spectrum}$	logical Flag indicating whether to sanity check input data, default is TRUE.	
use.cached.mult		
	logical Flag indicating whether multiplier values should be cached between calls.	
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.	

Value

a single numeric value giving the unitless energy ratio.

Note

The default for both w.band parameters is a waveband covering the whole range of w.length.

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

Examples

eq_ratio

Energy:photon ratio

Description

This function returns the energy to mole of photons ratio for each waveband and a light source spectrum.

```
eq_ratio(spct, w.band, scale.factor, wb.trim, use.cached.mult, use.hinges, ...)
## Default S3 method:
eq_ratio(spct, w.band, scale.factor, wb.trim, use.cached.mult, use.hinges, ...)
## S3 method for class 'source_spct'
eq_ratio(
    spct,
    w.band = NULL,
    scale.factor = 1,
    wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
    use.cached.mult = FALSE,
    use.hinges = NULL,
    naming = "short",
    name.tag = ifelse(naming != "none", "[e:q]", ""),
    ...
)
## S3 method for class 'source_mspct'
```

```
eq_ratio(
   spct,
   w.band = NULL,
   scale.factor = 1,
   wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
   use.cached.mult = FALSE,
   use.hinges = NULL,
   naming = "short",
   name.tag = ifelse(naming != "none", "[e:q]", ""),
   ...,
   attr2tb = NULL,
   idx = "spct.idx",
   .parallel = FALSE,
   .paropts = NULL
)
```

Arguments

spct source spct.

w. band waveband or list of waveband objects.

scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier

applied to returned values.

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if

FALSE, they are discarded.

use.cached.mult

logical Flag telling whether multiplier values should be cached between calls.

use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

... other arguments (possibly used by derived methods).

naming character one of "long", "default", "short" or "none". Used to select the type of

names to assign to returned value.

name.tag character Used to tag the name of the returned values.

attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to

formal parameter col.names.

idx character Name of the column with the names of the members of the collection

of spectra.

.parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

The ratio is based on one photon irradiance and one energy irradiance, both computed for the same waveband.

$$\frac{I(s, wb)}{Q(s, wb)}$$

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.#' @return Computed values are ratios between energy irradiance and photon irradiance for a given waveband. A named numeric vector in the case of methods for individual spectra, with one value for each waveband passed to parameter w.band. A data.frame in the case of collections of spectra, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used, with "[e:q]" prepended. Units [J mol-1].

Value

Computed values are ratios between energy irradiance and photon irradiance for a given waveband. A named numeric vector in the case of methods for individual spectra, with one value for each waveband passed to parameter w.band. A data.frame in the case of multiple spectra, containing one column with ratios for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

By default values are only integrated, but depending on the argument passed to parameter quantity they are expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used, with "[e:q]" prepended. Units [mol J-1].

Methods (by class)

- eq_ratio(default): Default for generic function
- eq_ratio(source_spct): Method for source_spct objects
- eq_ratio(source_mspct): Calculates energy:photon from a source_mspct object.

Performance

As this method accepts spectra as its input, it computes irradiances before computing the ratios. If you need to compute both ratios and irradiances from several hundreds or thousands of spectra, computing the ratios from previously computed irradiances avoids their repeated computation. A less dramatic, but still important, increase in performance is available when computing in the same function call ratios that share the same denominator.

Extract 119

See Also

## S3 method for class 'object_spct'
x[i, j, drop = NULL]

## S3 method for class 'chroma_spct'
x[i, j, drop = NULL]

## S3 replacement method for class 'generic_spct'
x[i, j] <- value

## S3 replacement method for class 'generic_spct'
x$name <- value</pre>
```

Arguments

X	spectral object from which to extract element(s) or in which to replace element(s)
i	index for rows,
j	index for columns, specifying elements to extract or replace. Indices are numeric or character vectors or empty (missing) or NULL. Please, see Extract for more details.
drop	logical. If TRUE the result is coerced to the lowest possible dimension. The default is FALSE unless the result is a single column.
value	A suitable replacement value: it will be repeated a whole number of times if necessary and it may be coerced: see the Coercion section. If NULL, deletes the column if a single column is selected.
name	A literal character string or a name (possibly backtick quoted). For extraction, this is normally (see under 'Environments') partially matched to the names of the object.

Details

These methods are just wrappers on the method for data frame objects which copy the additional attributes used by these classes, and validate the extracted object as a spectral object. When drop is TRUE and the returned object has only one column, then a vector is returned. If the extracted columns are more than one but do not include w.length, a data frame is returned instead of a spectral object.

Value

An object of the same class as x but containing only the subset of rows and columns that are selected. See details for special cases.

Note

If any argument is passed to j, even TRUE, some metadata attributes are removed from the returned object. This is how the extraction operator works with data.frames in R. For the time being we retain this behaviour for spectra, but it may change in the future.

Extract_mspct 121

See Also

```
subset and trim_spct
```

Examples

```
sun.spct[sun.spct[["w.length"]] > 400, ]
subset(sun.spct, w.length > 400)

tmp.spct <- sun.spct
tmp.spct[tmp.spct[["s.e.irrad"]] < 1e-5 , "s.e.irrad"] <- 0
e2q(tmp.spct[ , c("w.length", "s.e.irrad")]) # restore data consistency!</pre>
```

Extract_mspct

Extract or replace members of a collection of spectra

Description

Just like extraction and replacement with indexes for base R lists, but preserving the special attributes used in spectral classes.

Usage

```
## S3 method for class 'generic_mspct'
x[i, drop = NULL]

## S3 replacement method for class 'generic_mspct'
x[i] <- value

## S3 replacement method for class 'generic_mspct'
x$name <- value

## S3 replacement method for class 'generic_mspct'
x[name]] <- value</pre>
```

Arguments

x	Collection of spectra object from which to extract member(s) or in which to replace member(s)
i	Index specifying elements to extract or replace. Indices are numeric or character vectors. Please, see Extract for more details.
drop	If TRUE the result is coerced to the lowest possible dimension (see the examples). This only works for extracting elements, not for the replacement.
value	A suitable replacement value: it will be repeated a whole number of times if necessary and it may be coerced: see the Coercion section. If NULL, deletes the column if a single column is selected.

122 e_fluence

name

A literal character string or a name (possibly backtick quoted). For extraction, this is normally (see under 'Environments') partially matched to the names of the object.

Details

This method is a wrapper on base R's extract method for lists that sets additional attributes used by these classes.

Value

An object of the same class as x but containing only the subset of members that are selected.

e_fluence

Energy fluence

Description

Energy fluence for one or more wavebands of a light source spectrum and a duration of the exposure.

```
e_fluence(
  spct,
  w.band,
  exposure.time,
  scale.factor,
 wb.trim,
  use.cached.mult,
  use.hinges,
  allow.scaled,
)
## Default S3 method:
e_fluence(
  spct,
 w.band,
  exposure.time,
  scale.factor,
  wb.trim,
  use.cached.mult,
  use.hinges,
  allow.scaled,
)
```

e_fluence 123

```
## S3 method for class 'source_spct'
e_fluence(
  spct,
 w.band = NULL,
  exposure.time,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
 allow.scaled = FALSE,
  naming = "default",
)
## S3 method for class 'source_mspct'
e_fluence(
  spct,
 w.band = NULL,
  exposure.time,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
 use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
  allow.scaled = FALSE,
  attr2tb = NULL,
  idx = "spct.idx"
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct an R object

w.band a list of waveband objects or a waveband object

exposure.time lubridate::duration object.

scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier

applied to returned values.

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if

FALSE, they are discarded

use.cached.mult

logical indicating whether multiplier values should be cached between calls

use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

allow.scaled logical indicating whether scaled or normalized spectra as argument to spet are

flagged as an error

124 e_fluence

	other arguments (possibly ignored)
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
attr2tb	character vector, see ${\sf add_attr2tb}$ for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

One numeric value for each waveband with no change in scale factor, with name attribute set to the name of each waveband unless a named list is supplied in which case the names of the list elements are used. The exposure time is copied to the output as an attribute. Units are as follows: (J) joules per exposure.

Methods (by class)

- e_fluence(default): Default for generic function
- e_fluence(source_spct): Calculate energy fluence from a source_spct object and the duration of the exposure.
- e_fluence(source_mspct): Calculates energy fluence from a source_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

e_fraction 125

 $e_fraction$

Energy:energy fraction

Description

This function returns the energy fraction for a given pair of wavebands of a light source spectrum.

```
e_fraction(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
 wb.trim,
 use.cached.mult,
 use.hinges,
)
## Default S3 method:
e_fraction(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
 wb.trim,
 use.cached.mult,
 use.hinges,
)
## S3 method for class 'source_spct'
e_fraction(
  spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "total",
  naming = "short",
  name.tag = NULL,
)
```

126 e_fraction

```
## S3 method for class 'source_mspct'
e_fraction(
  spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "total",
  naming = "short",
  name.tag = ifelse(naming != "none", "[e:e]", ""),
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct

source_spct

Spec	source_spec
w.band.num	waveband object or a list of waveband objects used to compute the numerator(s) and denominator(s) of the fraction(s).
w.band.denom	waveband object or a list of waveband objects used to compute the denominator(s) of the fraction(s).
scale.factor	numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values.
wb.trim	logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded
use.cached.mult	
	logical Flag telling whether multiplier values should be cached between calls.
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
	other arguments (possibly used by derived methods).
quantity	character One of "total", "average" or "mean".
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
name.tag	character Used to tag the name of the returned values.
attr2tb	character vector, see $add_attr2tb$ for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach.

e_fraction 127

.paropts

a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "total" the fraction is based on two **energy irradiances**, one computed for each waveband.

$$\frac{E(s, wb_{\text{num}})}{E(s, wb_{\text{denom}}) + E(s, wb_{\text{num}})}$$

If the argument is set to quantity = "mean" or quantity = "average" the ratio is based on two **mean spectral energy irradiances**, one computed for each waveband.

$$\frac{\overline{Q_{\lambda}}(s, wb_{\text{num}})}{\overline{Q_{\lambda}}(s, wb_{\text{denom}}) + \overline{Q_{\lambda}}(s, wb_{\text{num}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[e:e]" is appended if quantity = "total" and "[e(wl):e(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

Methods (by class)

- e_fraction(default): Default for generic function
- e_fraction(source_spct): Method for source_spct objects
- e_fraction(source_mspct): Calculates energy:energy fraction from a source_mspct object.

Note

Recycling for wavebands takes place when the number of denominator and denominator wavebands differ. The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the

128 e_irrad

same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

```

e_irrad 129

```
)
## S3 method for class 'source_spct'
e_irrad(
  spct,
  w.band = NULL,
  quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
  allow.scaled = !quantity %in% c("average", "mean", "total"),
  naming = "default",
  return.tb = FALSE,
)
## S3 method for class 'source_mspct'
e_irrad(
  spct,
  w.band = NULL,
  quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
  allow.scaled = !quantity %in% c("average", "mean", "total"),
  naming = "default",
  attr2tb = NULL,
  idx = "spct.idx"
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct an R object.

w.band a list of waveband objects or a waveband object.

quantity character string One of "total", "average" or "mean", "contribution.pc", "relative" or "relative.pc".

time.unit character or lubridate::duration object.

scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values.

130 e_irrad

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded. use.cached.mult logical indicating whether multiplier values should be cached between calls. use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands. allow.scaled logical indicating whether scaled or normalized spectra as argument to spct are flagged as an error. other arguments (possibly used by derived methods). character one of "long", "default", "short" or "none". Used to select the type of naming names to assign to returned value. return.tb logical Flag forcing a tibble to be always returned, even for a single spectrum as argumnet to spct. The default is FALSE for backwards compatibility. attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names. character Name of the column with the names of the members of the collection idx of spectra. if TRUE, apply function in parallel, using parallel backend provided by foreach .parallel .paropts a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external

Value

A named numeric vector in the case of a _spct object containing a single spectrum and return.tb = FALSE. The vector has one member one value for each waveband passed to parameter w.band. In all other cases a tibble, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used. The time unit attribute is copied from the spectrum object to the output. Units are as follows: If units are absolute and time unit is second, [W m-2 nm-1] -> [W m-2] If time unit is day, [J d-1 m-2 nm-1] -> [J m-2]; if units are relative, fraction of one or percent.

Methods (by class)

- e_irrad(default): Default for generic function
- e_irrad(source_spct): Calculates energy irradiance from a source_spct object.
- e_irrad(source_mspct): Calculates energy irradiance from a source_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

  naming = "short",
 name.tag = ifelse(naming != "none", "[e:e]", ""),
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct	source_spct
w.band.num	waveband object or a list of waveband objects used to compute the numerator(s) of the $\text{ratio}(s)$.
w.band.denom	waveband object or a list of waveband objects used to compute the denominator(s) of the ratio(s).
scale.factor	numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values.
wb.trim	logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded
use.cached.mul	t
	logical Flag telling whether multiplier values should be cached between calls.
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
	other arguments (possibly used by derived methods).
quantity	character One of "total", "average" or "mean".
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
name.tag	character Used to tag the name of the returned values.
attr2tb	character vector, see <pre>add_attr2tb</pre> for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach.
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "total" the ratio is based on two energy irradiances, one computed for each waveband.

$$\frac{I(s, wb_{\text{num}})}{I(s, wb_{\text{denom}})}$$

If the argument is set to quantity = "mean" or quantity = "average" the ratio is based on two mean spectral photon irradiances, one computed for each waveband.

$$\frac{\overline{I_{\lambda}}(s, wb_{\text{num}})}{\overline{I_{\lambda}}(s, wb_{\text{denom}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[e:e]" is appended if quantity = "total" and "[e(wl):e(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Methods (by class)

- e_ratio(default): Default for generic function
- e_ratio(source_spct): Method for source_spct objects
- e_ratio(source_mspct): Calculates energy:energy ratio from a source_mspct object.

Performance

As this method accepts spectra as its input, it computes irradiances before computing the ratios. If you need to compute both ratios and irradiances from several hundreds or thousands of spectra, computing the ratios from previously computed irradiances avoids their repeated computation. A less dramatic, but still important, increase in performance is available when computing in the same function call ratios that share the same denominator.

```

Examples

e_response 135

e_response

Energy-based photo-response

Description

This function returns the mean, total, or contribution of response for each waveband and a response spectrum.

```
e_response(
  spct,
 w.band,
 quantity,
  time.unit,
  scale.factor,
 wb.trim,
  use.hinges,
)
## Default S3 method:
e_response(
  spct,
 w.band,
  quantity,
  time.unit,
  scale.factor,
 wb.trim,
  use.hinges,
)
## S3 method for class 'response_spct'
e_response(
  spct,
 w.band = NULL,
  quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = getOption("photobiology.use.hinges", default = NULL),
  naming = "default",
)
## S3 method for class 'response_mspct'
```

e_response

```
e_response(
    spct,
    w.band = NULL,
    quantity = "total",
    time.unit = NULL,
    scale.factor = 1,
    wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
    use.hinges = getOption("photobiology.use.hinges", default = NULL),
    naming = "default",
    ...,
    attr2tb = NULL,
    idx = "spct.idx",
    .parallel = FALSE,
    .paropts = NULL
)
```

Arguments

spct	an R object.
w.band	waveband or list of waveband objects or a numeric vector of length two. The waveband(s) determine the region(s) of the spectrum that are summarized. If a numeric range is supplied a waveband object is constructed on the fly from it.
quantity	character string One of "total", "average" or "mean", "contribution", "contribution.pc", "relative" or "relative.pc".
time.unit	character or lubridate::duration object.
scale.factor	numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values.
wb.trim	logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded.
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
	other arguments (possibly used by derived methods).
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
attr2tb	character vector, see <pre>add_attr2tb</pre> for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

FEL_spectrum 137

Value

A named numeric vector in the case of methods for individual spectra, with one value for each waveband passed to parameter w.band. A data.frame in the case of collections of spectra, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used.

Methods (by class)

- e_response(default): Default method for generic function
- e_response(response_spct): Method for response spectra.
- e_response(response_mspct): Calculates energy response from a response_mspct

Note

The parameter use.hinges controls speed optimization. The defaults should be suitable in most cases. Only the range of wavelengths in the wavebands is used and all BSWFs are ignored.

See Also

```
e_response(ccd.spct, new_waveband(200,300))
e_response(photodiode.spct)
```

FEL_spectrum

Incandescent "FEL" lamp emission spectrum

Description

Calculate values by means of a nth degree polynomial from user-supplied constants (for example from a lamp calibration certificate).

```
FEL_spectrum(w.length, k = photobiology::FEL.BN.9101.165, fill = NA_real_)
```

138 findMultipleWI

Arguments

w.length numeric vector of wavelengths (nm) for outputk a numeric vector with n constants for the function

fill if NA, no extrapolation is done, and NA is returned for wavelengths outside the

range 250 nm to 900 nm. If NULL then the tails are deleted. If 0 then the tails

are set to zero, etc. NA is default.

Value

a dataframe with four numeric vectors with wavelength values (w.length), energy and photon irradiance (s.e.irrad, s.q.irrad) depending on the argument passed to unit.out (s.irrad).

Note

This is function is valid for wavelengths in the range 250 nm to 900 nm, for wavelengths outside this range NAs are returned.

Examples

```
FEL_spectrum(400)
FEL_spectrum(250:900)
```

findMultipleWl

Find repeated w.length values

Description

Find repeated w.length values

Usage

```
findMultipleWl(x, same.wls = TRUE)
```

Arguments

x a generic_spct object

same.wls logical If TRUE all spectra spected to share same w.length values.

Value

integer Number of spectra, guessed from the number of copies of each individual w.length value.

find_peaks 139

find_peaks	Find peaks in a spectrum	

Description

This function finds all peaks (local maxima) in a spectrum, using a user provided size threshold relative to the tallest peak (global maximum) bellow which found peaks are ignored—i.e., not included in the returned value. This is a wrapper built on top of function peaks() from package 'splus2R'.

Usage

```
find_peaks(x, ignore_threshold = 0, span = 3, strict = TRUE, na.rm = FALSE)
```

Arguments

x ignore_thresho	numeric vector ld
	numeric Value between 0.0 and 1.0 indicating the relative size compared to tallest peak threshold below which peaks will be ignored. Negative values set a threshold so that the tallest peaks are ignored, instead of the shortest.
span	integer A peak is defined as an element in a sequence which is greater than all other elements within a window of width span centered at that element. Use NULL for the global peak.
strict	logical If TRUE, an element must be strictly greater than all other values in its window to be considered a peak.
na.rm	logical indicating whether NA values should be stripped before searching for peaks.

Value

A logical vector of the same length as x. Values that are TRUE correspond to local peaks in the data.

Note

This function is a wrapper built on function peaks from **splus2R** and handles non-finite (including NA) values differently than splus2R::peaks, instead of giving an error they are replaced with the smallest finite value in x.

Examples

```
with(sun.data, w.length[find_peaks(s.e.irrad)])
```

find_spikes

find_spikes

Find spikes

Description

This function finds spikes in a numeric vector using the algorithm of Whitaker and Hayes (2018). Spikes are values in spectra that are unusually high or low compared to neighbors. They are usually individual values or very short runs of similar "unusual" values. Spikes caused by cosmic radiation are a frequent problem in Raman spectra. Another source of spikes are "hot pixels" in CCD and diode arrays. Other kinds of accidental "outlayers" will be also detected.

Usage

```
find_spikes(
   x,
   x.is.delta = FALSE,
   z.threshold = 9,
   max.spike.width = 8,
   na.rm = FALSE
)
```

Arguments

x numeric vector containing spectral data.

x.is.delta logical Flag indicating if x contains already differences.

z. threshold numeric Modified Z values larger than z. threshold are considered to be spikes.

max.spike.width

integer Wider regions with high Z values are not detected as spikes.

na.rm logical indicating whether NA values should be stripped before searching for

spikes.

Details

Spikes are detected based on a modified Z score calculated from the differenced spectrum. The Z threshold used should be adjusted to the characteristics of the input and desired sensitivity. The lower the threshold the more stringent the test becomes, resulting in most cases in more spikes being detected. A modified version of the algorithm is used if a value different from NULL is passed as argument to $\max. spike.width$. In such a case, an additional step filters out broader spikes (or falsely detected steep slopes) from the returned values.

Value

A logical vector of the same length as x. Values that are TRUE correspond to local spikes in the data.

Examples

find_wls

Find wavelength values in a spectrum

Description

Find wavelength values corresponding to a target y value in any spectrum. The name of the column of the spectral data to be used to match the target needs to be passed as argument unless the spectrum contains a single numerical variable in addition to "w.length".

Usage

```
find_wls(
    x,
    target = NULL,
    col.name.x = NULL,
    col.name = NULL,
    .fun = `<=`,
    interpolate = FALSE,
    idfactor = length(target) > 1,
    na.rm = FALSE
)
```

Arguments

target

an R object

numeric or character. A numeric value indicates the spectral quantity value for which wavelengths are to be searched. A character representing a number is converted to a number. A character value representing a number followed by a function name, will be also accepted and decoded, such that "0.1max" is interpreted as targetting one tenthof the maximum value in a column. The character strings "half.maximum" and "HM" are synonyms for "0.5max" while "half.range" and "HR" are synonyms for "0.5range". These synonyms are converted to the cannonical form before saving them to the returned value.

find_wls

col.name.x	character The name of the column in which to the independent variable is stored. Defaults to "w.length" for objects of class "generic_spct" or derived.
col.name	character The name of the column in which to search for the target value.
.fun	function A binary comparison function or operator.
interpolate	logical Indicating whether the nearest wavelength value in x should be returned or a value calculated by linear interpolation between wavelength values stradling the target.
idfactor	logical or character Generates an index column of factor type. If idfactor = TRUE then the column is auto named target.idx. Alternatively the column name can be directly passed as argument to idfactor as a character string.
na.rm	logical indicating whether NA values should be stripped before searching for the target.

Value

A spectrum object of the same class as x with fewer rows, possibly even no rows. If FALSE is passed to interpolate a subset of x is returned, otherwise a new object of the same class containing interpolated wavelenths for the target value is returned.

Note

This function is used internally by method wls_at_target(), and these methods should be preferred in user code and scripts.

Examples

```
find_wls(white_led.source_spct)
find_wls(white_led.source_spct, target = "0.5max")
find_wls(white_led.source_spct, target = 0.4)
find_wls(white_led.source_spct, target = 0.4, interpolate = TRUE)
find_wls(white_led.source_spct, target = c(0.3, 0.4))
find_wls(white_led.source_spct, target = c(0.3, 0.4), idfactor = "target")
find_wls(white_led.source_spct, target = c(0.3, 0.4), idfactor = TRUE)
find_wls(white_led.source_spct, target = "0.5max")
find_wls(white_led.source_spct, target = "0.05max")
find_wls(white_led.source_spct, target = "0.5range")
led.df <- as.data.frame(white_led.source_spct)</pre>
find_wls(led.df)
find_wls(led.df, col.name = "s.e.irrad", col.name.x = "w.length")
find_wls(led.df, col.name = "s.e.irrad", col.name.x = "w.length",
         target = 0.4)
find_wls(led.df, col.name = "s.e.irrad", col.name.x = "w.length",
         target = c(0.3, 0.4))
find_wls(led.df, col.name = "s.e.irrad", col.name.x = "w.length",
         target = 0.4, idfactor = "target")
```

fit_peaks 143

fit_peaks

Refine position and value of extremes by fitting

Description

Functions implementing fitting of peaks in a class-agnostic way. The fitting refines the location of peaks and value of peaks based on the location of maxima and minima supplied. This function is to be used together with find_peaks() or find_valleys().

Usage

```
fit_peaks(
  х,
  peaks.idx,
  span,
 x.col.name = NULL,
 y.col.name,
 method,
 max.span = 5L,
 maximum = TRUE,
 keep.cols = NULL
)
fit_valleys(
  Х,
  valleys.idx,
  span,
  x.col.name = NULL,
 y.col.name,
 method,
 max.span = 5L,
 maximum = FALSE,
 keep.cols = NULL
)
```

Arguments

144 fluence

max.span	odd integer The maximum number of data points used when when refining the location of maxima and minima.
maximum	logical A flag indicating whether to search for maxima or minima.
keep.cols	logical Keep unrecognized columns in data frames

Value

An R object of the same class as x containing the fitted values for the peaks, and optionally the values for at peaks.idx or valleys.idx for other retained columns.

Note

These functions are not meant for everyday use. Use option refine.wl = TRUE of methods peaks() and valleys() instead.

Examples

fluence Fluence

Description

Energy or photon fluence for one or more wavebands of a light source spectrum and a duration of exposure.

```
fluence(
   spct,
   w.band,
   unit.out,
   exposure.time,
   scale.factor,
   wb.trim,
   use.cached.mult,
   use.hinges,
   allow.scaled,
   ...
)

## Default S3 method:
fluence(
```

fluence 145

```
spct,
 w.band,
 unit.out,
  exposure.time,
  scale.factor,
 wb.trim,
 use.cached.mult,
 use.hinges,
 allow.scaled,
)
## S3 method for class 'source_spct'
fluence(
  spct,
 w.band = NULL,
 unit.out = getOption("photobiology.radiation.unit", default = "energy"),
  exposure.time,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
 use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
 use.hinges = NULL,
 allow.scaled = FALSE,
 naming = "default",
)
## S3 method for class 'source_mspct'
fluence(
  spct,
 w.band = NULL,
 unit.out = getOption("photobiology.radiation.unit", default = "energy"),
  exposure.time,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
  allow.scaled = FALSE,
 naming = "default",
  . . . ,
 attr2tb = NULL,
  idx = "spct.idx";
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct an R object.

146 fluence

unit.out character string with allowed values "energy", and "photon", or its alias "quantum". exposure.time lubridate::duration object. scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values. wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded. use.cached.mult logical indicating whether multiplier values should be cached between calls. use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands. allow.scaled logical indicating whether scaled or normalized spectra as argument to spect are flagged as an error. other arguments (possibly used by derived methods). naming character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value. attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names. idx character Name of the column with the names of the members of the collection of spectra. .parallel if TRUE, apply function in parallel, using parallel backend provided by foreach a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the export and packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

One numeric value for each waveband with no change in scale factor, with name attribute set to the name of each waveband unless a named list is supplied in which case the names of the list elements are used. The time unit attribute is copied from the spectrum object to the output. Units are as follows: If time unit is second, [W m-2 nm-1] -> [mol s-1 m-2] If time unit is day, [J d-1 m-2 nm-1] -> [mol d-1 m-2]

Methods (by class)

- fluence(default): Default for generic function
- fluence(source_spct): Calculate photon fluence from a source_spct object and the duration of the exposure
- fluence(source_mspct): Calculates fluence from a source_mspct object.

formatted_range 147

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

formatted_range

Compute range and format it

Description

Compute the range of an R object, and format it as string suitable for printing.

Usage

```
formatted_range(x, na.rm = TRUE, digits = 3, nsmall = 2, collapse = "..")
```

Arguments

```
x an R object
na.rm logical, indicating if NA's should be omitted.
digits, nsmall numeric, passed to same name parameters of format().
collapse character, passed to same name parameter of paste().
```

fscale

Rescale a spectrum using a summary function

Description

These methods return a spectral object of the same class as the one supplied as argument but with the spectral data rescaled based on a summary function f applied over a specific range of wavelengths and a target value for the summary value. When the object contains multiple spectra, the rescaling is applied separately to each spectrum.

Usage

```
fscale(x, ...)
## Default S3 method:
fscale(x, ...)
## S3 method for class 'source_spct'
fscale(
  х,
  range = NULL,
  f = "mean",
  target = 1,
  unit.out = getOption("photobiology.radiation.unit", default = "energy"),
  set.scaled = target == 1,
)

```

Arguments

x	An R object
	additional named arguments passed down to f.
range	numeric. An R object on which range() returns a numeric vector of length 2 with the limits of a range of wavelengths in nm, with min and max wavelengths (nm)
f	character string. "mean" or "total" for scaling so that this summary value becomes 1 for the returned object, or the name of a function taking x as first argument and returning a numeric value.
target	numeric A constant used as target value for scaling.
unit.out	character. Allowed values "energy", and "photon", or its alias "quantum".
set.scaled	logical or NULL Flag indicating if the data is to be marked as "scaled" or not.
qty.out	character. Allowed values "transmittance", and "absorbance".
col.names	character vector containing the names of columns or variables to which to apply the scaling.
.parallel	logical if TRUE, apply function in parallel, using parallel backend provided by foreach.
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

After scaling, calling the function passed as argument to f with the scaled spectrum as argument, will return the value passed as argument to target. The default for set.scaled depends dynamically on the value passed to target. Sometimes we rescale a spectrum to a "theoretical" value for the summary, while in other cases we rescale the spectrum to a real-world target value of, e.g., a reference energy irradiance. In the first case we say that the data are expressed in relative units, while in the second case we retain actual physical units. To indicate this, the default argument for 'set.scaled' is TRUE when target == 1, assuming the first of these two situations, and false otherwise, assuming the second situation. These defaults can be overriden with an explicit logical argument passed to set.scaled. Scaling overrides any previous normalization with the spectrum tagged as not normalized.

Method fscale is implemented for solute_spct objects but as the spectral data stored in them are a description of an intensive property of a substance, scaling is unlikely to useful. To represent solutions of specific concentrations of solutes, filter_spct objects should be used instead.

Value

A copy of the object passed as argument to x with the original spectral data values replaced with rescaled values, and the "scaled" attribute set to a list describing the scaling applied.

a new object of the same class as x.

Methods (by class)

```
fscale(default): Default for generic functionfscale(source_spct):fscale(response_spct):
```

• fscale(filter_spct):

• fscale(reflector_spct):

• fscale(solute_spct):

• fscale(raw_spct):

• fscale(cps_spct):

• fscale(generic_spct):

• fscale(source_mspct):

• fscale(response_mspct):

• fscale(filter_mspct):

• fscale(reflector_mspct):

• fscale(solute_mspct):

• fscale(raw_mspct):

• fscale(cps_mspct):

• fscale(generic_mspct):

Important changes

Metadata describing the rescaling operation are stored in an attribute only if set.scaled = TRUE is passed to the call. The exact format and data stored in the attribute "scaled" has changed during the development history of the package. Spectra re-scaled with earlier versions will lack some information. To obtain the metadata in a consistent format irrespective of this variation use accessor getScaling(), which fills missing fields with NA.

See Also

```
Other rescaling functions: fshift(), getNormalized(), getScaled(), is_normalized(), is_scaled(), normalize(), setNormalized(), setScaled()
```

Examples

fshift

Shift the scale of a spectrum using a summary function

Description

The fshift() methods return a spectral object of the same class as the one supplied as argument but with the spectral data on a zero-shifted scale. A range of wavelengths is taken as a zero reference and the summary calculated with f for this waveband is substracted. This results in a zero shift (= additive correction) to the values in the returned object. Metadata attributes are retained unchanged.

Usage

```
fshift(x, ...)
## Default S3 method:
fshift(x, ...)
## S3 method for class 'source_spct'
fshift(
  х,
  range = c(wl_min(x), wl_min(x) + 10),
  f = "mean",
  unit.out = getOption("photobiology.radiation.unit", default = "energy"),
)
## S3 method for class 'response_spct'
fshift(
  range = c(wl_min(x), wl_min(x) + 10),
  f = "mean",
  unit.out = getOption("photobiology.radiation.unit", default = "energy"),
)
## S3 method for class 'filter_spct'
fshift(
  Х,
  range = c(wl_min(x), wl_min(x) + 10),
  f = "min",
  qty.out = getOption("photobiology.filter.qty", default = "transmittance"),
)
## S3 method for class 'reflector_spct'
fshift(x, range = c(wl_min(x), wl_min(x) + 10), f = "min", qty.out = NULL, ...)
```

```
## S3 method for class 'source_mspct'
fshift(
  Х,
  range = c(wl_min(x), wl_min(x) + 10),
  f = "mean",
 unit.out = getOption("photobiology.radiation.unit", default = "energy"),
)
## S3 method for class 'raw_spct'
fshift(
 х,
 range = c(wl_min(x), wl_min(x) + 10),
  f = "mean",
 qty.out = NULL,
)
## S3 method for class 'cps_spct'
fshift(
 х,
 range = c(wl_min(x), wl_min(x) + 10),
 f = "mean",
 qty.out = NULL,
)
## S3 method for class 'generic_spct'
fshift(x, range = c(wl_min(x), wl_min(x) + 10), f = "mean", col.names, ...)
## S3 method for class 'response_mspct'
fshift(
  х,
  range = c(wl_min(x), wl_min(x) + 10),
  f = "mean",
  unit.out = getOption("photobiology.radiation.unit", default = "energy"),
  .parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'filter_mspct'
fshift(
 х,
  range = c(wl_min(x), wl_min(x) + 10),
  f = "min",
  qty.out = getOption("photobiology.filter.qty", default = "transmittance"),
  . . . ,
```

```
.parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'reflector_mspct'
fshift(
 х,
 range = c(wl_min(x), wl_min(x) + 10),
 f = "min",
 qty.out = NULL,
  .parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'raw_mspct'
fshift(
 Х,
 range = c(wl_min(x), wl_min(x) + 10),
  f = "min",
  . . . ,
  .parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'cps_mspct'
fshift(
 Х,
 range = c(wl_min(x), wl_min(x) + 10),
 f = "min",
  . . . ,
  .parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'generic_mspct'
fshift(
 range = c(wl_min(x), wl_min(x) + 10),
 f = "min",
 col.names,
  . . . ,
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

x An R object

	additional named arguments passed down to f.
range	An R object on which range() returns a numeric vector of length 2 with the limits of a range of wavelengths in nm, with min and max wavelengths (nm)
f	character string "mean", "min" or "max" for scaling so that this summary value becomes the origin of the spectral data scale in the returned object, or the name of a function taking x as first argument and returning a numeric value.
unit.out	character Allowed values "energy", and "photon", or its alias "quantum"
qty.out	character Allowed values "transmittance", and "absorbance"
col.names	character vector containing the names of columns or variables to which to apply the scale shift.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A copy of x with the spectral data values replaced with values zero-shifted. a new object of the same class as x.

Methods (by class)

```
fshift(default): Default for generic functionfshift(source_spct):
```

• fshift(response_spct):

• fshift(filter_spct):

• fshift(reflector_spct):

• fshift(source_mspct):

• fshift(raw_spct):

• fshift(cps_spct):

• fshift(generic_spct):

• fshift(response_mspct):

• fshift(filter_mspct):

• fshift(reflector_mspct):

• fshift(raw_mspct):

• fshift(cps_mspct):

• fshift(generic_mspct):

Note

Method fshift is not implemented for solute_spct objects as the spectral data stored in them are a description of an intensive property of a substance. To represent solutions of specific concentrations of solutes, filter_spct objects can be used.

158 generic_mspct

See Also

Other rescaling functions: fscale(), getNormalized(), getScaled(), is_normalized(), is_scaled(), normalize(), setNormalized(), setScaled()

generic_mspct

Collection-of-spectra constructor

Description

Converts a list of spectral objects into a "multi spectrum" object by setting the class attribute of the list of spectra to the corresponding multi-spec class, check that components of the list belong to the expected class.

Usage

```
generic_mspct(
  1 = NULL,
  class = "generic_spct",
 ncol = 1,
 byrow = FALSE,
 dim = c(length(1)%/%ncol, ncol)
calibration_mspct(l = NULL, ncol = 1, byrow = FALSE, ...)
raw_mspct(l = NULL, ncol = 1, byrow = FALSE, ...)
cps_mspct(l = NULL, ncol = 1, byrow = FALSE, ...)
source_mspct(1 = NULL, ncol = 1, byrow = FALSE, ...)
filter_mspct(l = NULL, ncol = 1, byrow = FALSE, ...)
reflector_mspct(l = NULL, ncol = 1, byrow = FALSE, ...)
object_mspct(1 = NULL, ncol = 1, byrow = FALSE, ...)
solute_mspct(l = NULL, ncol = 1, byrow = FALSE, ...)
response_mspct(1 = NULL, ncol = 1, byrow = FALSE, ...)
chroma_mspct(l = NULL, ncol = 1, byrow = FALSE, ...)
```

Arguments

list of generic_spct or derived classes

getFilterProperties 159

class	character The multi spectrum object class or the expected class for the elements of l
ncol	integer Number of 'virtual' columns in data
byrow	logical If ncol > 1 how to read in the data
dim	integer vector of dimensions
	ignored

Functions

• calibration_mspct(): Specialization for collections of calibration_spct objects.

• raw_mspct(): Specialization for collections of raw_spct objects.

• cps_mspct(): Specialization for collections of cps_spct objects.

• source_mspct(): Specialization for collections of source_spct objects.

• filter_mspct(): Specialization for collections of filter_spct objects.

• reflector_mspct(): Specialization for collections of reflector_spct objects.

• object_mspct(): Specialization for collections of object_spct objects.

• solute_mspct(): Specialization for collections of solute_spct objects.

• response_mspct(): Specialization for collections of response_spct objects.

• chroma_mspct(): Specialization for collections of chroma_spct objects.

Note

Setting class = source_spct or class = source_mspct makes no difference

Examples

```
filter_mspct(list(polyester.spct, yellow_gel.spct))
```

 ${\tt getFilterProperties} \quad \textit{Get the "filter.properties" attribute}$

Description

Function to read the "filter.properties" attribute of an existing filter_spct or a filter_mspct.

160 getFilterProperties

Usage

```
getFilterProperties(x, return.null, ...)

filter_properties(x, return.null, ...)

## Default S3 method:
getFilterProperties(x, return.null = FALSE, ...)

## S3 method for class 'filter_spct'
getFilterProperties(x, return.null = FALSE, ...)

## S3 method for class 'summary_filter_spct'
getFilterProperties(x, return.null = FALSE, ...)

## S3 method for class 'generic_mspct'
getFilterProperties(x, return.null = FALSE, ..., idx = "spct.idx")
```

Arguments

X	a filter_spct object	
return.null	logical If true, NULL is returned if the attribute is not set, otherwise the expected list is returned with all fields set to NA.	
	Allows use of additional arguments in methods for other classes.	
idx	character Name of the column with the names of the members of the collection of spectra.	

Value

a list with fields named "Rfr.constant" [/1], "thickness" [m] and "attenuation.mode". If the attribute is not set, and return.null is FALSE, a list with fields set to NA is returned, otherwise, NULL.

Methods (by class)

- getFilterProperties(default): default
- getFilterProperties(filter_spct): generic_spct
- getFilterProperties(summary_filter_spct): summary_generic_spct
- getFilterProperties(generic_mspct): filter_mspct

Note

The method for collections of spectra returns the a tibble with a column of lists.

getHowMeasured 161

See Also

```
Other measurement metadata functions: add_attr2tb(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

Examples

```
filter_properties(polyester.spct)
```

getHowMeasured

Get the "how.measured" attribute

Description

Function to read the "how.measured" attribute of an existing generic_spct, generic_mspct, summary_generic_spct, data.frame or a derived-class object.

Usage

```
getHowMeasured(x, ...)
how_measured(x, ...)
## Default S3 method:
getHowMeasured(x, ...)
## S3 method for class 'generic_spct'
getHowMeasured(x, ...)
## S3 method for class 'summary_generic_spct'
getHowMeasured(x, ...)
## S3 method for class 'data.frame'
getHowMeasured(x, ...)
## S3 method for class 'generic_mspct'
getHowMeasured(x, ...)
```

Arguments

```
x a generic_spct object
```

- ... Allows use of additional arguments in methods for other classes.
- idx character Name of the column with the names of the members of the collection of spectra.

162 getIdFactor

Value

character vector An object containing a description of the data.

Methods (by class)

- getHowMeasured(default): default
- getHowMeasured(generic_spct): generic_spct
- getHowMeasured(summary_generic_spct): summary_generic_spct
- getHowMeasured(data.frame): data.frame
- getHowMeasured(generic_mspct): generic_mspct

Note

The method for collections of spectra returns the a tibble with a column of character strings.

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

Examples

```
how_measured(sun.spct)
```

getIdFactor

Get the "idfactor" attribute

Description

Function to read the idfactor attribute of an existing generic_spct.

Usage

```
getIdFactor(x)
id_factor(x)
```

Arguments

Х

a generic_spct object

getInstrDesc 163

Value

character

Note

If x is not a generic_spct or an object of a derived class NA is returned.

See Also

Other idfactor attribute functions: setIdFactor()

Examples

```
id_factor(sun_evening.spct)
```

getInstrDesc

Get the "instr.desc" attribute

Description

Function to read the "instr.desc" attribute of an existing generic_spct object.

Usage

```
getInstrDesc(x)
instr_descriptor(x)
```

Arguments

Х

a generic_spct object

Value

list (depends on instrument type)

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrSettings(), select_spct_attributes(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

164 getKType

getInstrSettings

Get the "instr.settings" attribute

Description

Function to read the "instr.settings" attribute of an existing generic_spct object.

Usage

```
getInstrSettings(x)
instr_settings(x)
```

Arguments

Х

a generic_spct object

Value

list

See Also

Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), getZattributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()

getKType

Get the "K.type" attribute

Description

Function to read the "K.type" attribute of an existing solute_spct object.

Usage

```
getKType(x)
```

Arguments

Х

a solute_spct object

getMspctVersion 165

Value

character string

Note

If x is not a solute_spct or a summary_solute_spct object, NA is returned.

See Also

```
Other K attribute functions: setKType()
```

Examples

```
print("missing example")
```

 ${\tt getMspctVersion}$

Get the "mspct.version" attribute

Description

Function to read the "mspct.version" attribute of an existing generic_mspct object.

Usage

```
getMspctVersion(x)
```

Arguments

x

a generic_mspct object

Value

numeric value

Note

if x is not a generic_mspct object, NA is returned, and if it the attribute is missing, zero is returned with a warning.

166 getNormalized

getMultipleWl

Get the "multiple.wl" attribute

Description

Function to query the value of the multiple.wl attribute of an existing generic_spct.

Usage

```
getMultipleWl(x)
multiple_wl(x)
```

Arguments

Х

a generic_spct object

Value

integer value, the value of attribute multiple.wl, or NA if the attribute is not set, or if x is not a generic_spct object or an object of a derived class.

See Also

Other multiple.wl attribute functions: setMultipleWl()

Examples

```
multiple_wl(sun.spct)
multiple_wl(sun_evening.spct)
```

getNormalized

Query the "normalized" and "normalization" attributes

Description

Functions to read the "normalized" and "normalization" attributes of an existing generic_spct object.

Usage

```
getNormalized(x, .force.numeric = FALSE)
getNormalised(x, .force.numeric = FALSE)
getNormalization(x)
getNormalization(x)
```

getNormalized 167

Arguments

```
x a generic_spct object.
```

.force.numeric logical If TRUE always silently return a numeric value, with FALSE encoded as zero, and character values as NA.

Details

Spectral data that has been normalized needs to be used differently in computations than data expressed in original units. These two functions make it possible to query if data stored in an object of class generic_spct or of a derived class contains data expressed in physical units or normalized. In the later case, it is possible to also query how the normalization was done.

Value

getNormalized() returns numeric or logical (possibly character for objects created with earlier versions); for collections of spectra, a named list, with one member for each spectrum. If x is not a generic_spct object, NA or a list with fields set to NAs is returned. Objects created with versions of package 'photobiology' earlier than 0.10.8 are lacking the detailed normalization metadata.

getNormalization() returns a list with five fields: norm.type, norm.wl, norm.factors, norm.cols, norm.range. For collections of spectra, a named list of lists, with one member list for each member of the collection of spectra. See setNormalized() for the values stored in the fields.

Note

getNormalised() is a synonym for this getNormalized() method.

See Also

```
Other rescaling functions: fscale(), fshift(), getScaled(), is_normalized(), is_scaled(), normalize(), setNormalized(), setScaled()
```

Examples

```
getNormalized(sun.spct)
getNormalization(sun.spct)
sun_norm.spct <- normalize(sun.spct)
getNormalized(sun_norm.spct)
getNormalization(sun_norm.spct)
getNormalization(e2q(sun_norm.spct))
gel_norm.spct <- normalize(yellow_gel.spct)
getNormalization(gel_norm.spct)
getNormalization(gel_norm.spct)
# getNormalization(gel_norm.spct)</pre>
```

168 getScaled

getScaled

Get the "scaled" attribute

Description

Function to read the "scaled" attribute of an existing generic_spct object.

Usage

```
getScaled(x, .force.list = FALSE)
getScaling(x)
```

Arguments

x a generic_spct object

. force.list logical If TRUE always silently return a list, with FALSE encoded field multiplier = 1.

Value

logical

Note

if x is not a filter_spct object, NA is returned

See Also

```
Other rescaling functions: fscale(), fshift(), getNormalized(), is_normalized(), is_scaled(), normalize(), setNormalized(), setScaled()
```

Examples

```
scaled.spct <- fscale(sun.spct)
getScaled(scaled.spct)</pre>
```

getSoluteProperties 169

getSoluteProperties Get the "solute.properties" attribute

Description

Function to read the "solute.properties" attribute of an existing solute_spct or a solute_mspct objects.

Usage

```
getSoluteProperties(x, return.null, ...)

## Default S3 method:
getSoluteProperties(x, return.null = FALSE, ...)

## S3 method for class 'solute_spct'
getSoluteProperties(x, return.null = FALSE, ...)

## S3 method for class 'summary_solute_spct'
getSoluteProperties(x, return.null = FALSE, ...)

## S3 method for class 'summary_solute_spct'
getSoluteProperties(x, return.null = FALSE, ...)

## S3 method for class 'solute_mspct'
getSoluteProperties(x, return.null = FALSE, ..., idx = "spct.idx")
```

Arguments

Χ	solute_spct A spectrum of coefficients of attenuation.
return.null	logical If true, NULL is returned if the attribute is not set, otherwise the expected list is returned with all fields set to NA.
	Allows use of additional arguments in methods for other classes.
idx	character Name of the column with the names of the members of the collection of spectra.

Value

a list with fields named "mass", "formula", "structure", "name" and "ID". If the attribute is not set, and return.null is FALSE, a list with fields set to NA is returned, otherwise, NULL.

Methods (by class)

- getSoluteProperties(default): default
- getSoluteProperties(solute_spct): solute_spct
- getSoluteProperties(summary_solute_spct): summary_solute_spct
- getSoluteProperties(solute_mspct): solute_mspct

170 getSpctVersion

Note

The method for collections of spectra returns the a tibble with a column of lists.

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrDesc(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), getWhereMeasured(), getWhereMeasured(), getWhereMeasured(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrDesc(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrDesc(), trimInstrDesc()
```

Examples

```
solute_properties(water.spct)
```

getSpctVersion

Get the "spct.version" attribute

Description

Function to read the "spct.version" attribute of an existing generic_spct object.

Usage

```
getSpctVersion(x)
```

Arguments

Χ

a generic_spct object

Value

integer value

Note

if x is not a generic_spct object, NA is returned, and if it the attribute is missing, zero is returned with a warning.

getTimeUnit 171

getTimeUnit

Get the "time.unit" attribute of an existing source_spct object

Description

Function to read the "time.unit" attribute

Usage

```
getTimeUnit(x, force.duration = FALSE)
```

Arguments

x a source_spct object

force.duration logical If TRUE a lubridate::duration is returned even if the object attribute is a character string, if no conversion is possible NA is returned.

Value

character string or a lubridate::duration

Note

if x is not a source_spct or a response_spct object, NA is returned

See Also

```
Other time attribute functions: checkTimeUnit(), convertThickness(), convertTimeUnit(), setTimeUnit()
```

Examples

```
getTimeUnit(sun.spct)
```

getWhatMeasured

Get the "what.measured" attribute

Description

Function to read the "what.measured" attribute of an existing generic_spct, generic_mspct, summary_generic_spct, data.frame or a derived-class object.

172 getWhatMeasured

Usage

```
getWhatMeasured(x, ...)
what_measured(x, ...)
## Default S3 method:
getWhatMeasured(x, ...)
## S3 method for class 'generic_spct'
getWhatMeasured(x, ...)
## S3 method for class 'summary_generic_spct'
getWhatMeasured(x, ...)
## S3 method for class 'data.frame'
getWhatMeasured(x, ...)
## S3 method for class 'generic_mspct'
getWhatMeasured(x, ...)
```

Arguments

x a generic_spct object
 ... Allows use of additional arguments in methods for other classes.
 idx character Name of the column with the names of the members of the collection of spectra.

Value

character vector An object containing a description of the data.

Methods (by class)

- getWhatMeasured(default): default
- getWhatMeasured(generic_spct): generic_spct
- getWhatMeasured(summary_generic_spct): summary_generic_spct
- getWhatMeasured(data.frame): data.frame
- getWhatMeasured(generic_mspct): generic_mspct

Note

The method for collections of spectra returns the a tibble with a column of character strings.

getWhenMeasured 173

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrDesc(), getSoluteProperties(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrDesc(), select_spct_attributes(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrDesc(), setSoluteProperties(), setWhatMeasured(), setWhenMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrDesc(), trimInstrDesc()
```

Examples

```
what_measured(sun.spct)
```

getWhenMeasured

Get the "when.measured" attribute

Description

Function to read the "when.measured" attribute of an existing generic_spct, generic_mspct, summary_generic_spct, data.frame or a derived-class object.

Usage

```
getWhenMeasured(x, ...)
when_measured(x, ...)
## Default S3 method:
getWhenMeasured(x, ...)
## S3 method for class 'generic_spct'
getWhenMeasured(x, as.df = FALSE, ...)
## S3 method for class 'summary_generic_spct'
getWhenMeasured(x, as.df = FALSE, ...)
## S3 method for class 'data.frame'
getWhenMeasured(x, as.df = FALSE, ...)
## S3 method for class 'generic_mspct'
getWhenMeasured(x, ..., idx = "spct.idx")
```

Arguments

```
x a generic_spct object
```

... Allows use of additional arguments in methods for other classes.

174 getWhereMeasured

as.df	logical If TRUE return a data frame instead of a list, when the value stored in the attribute is a list.
idx	character Name of the column with the names of the members of the collection of spectra.

Value

POSIXct An object with date and time.

Methods (by class)

- getWhenMeasured(default): default
- getWhenMeasured(generic_spct): generic_spct
- getWhenMeasured(summary_generic_spct): summary_generic_spct
- getWhenMeasured(data.frame): data.frame
- getWhenMeasured(generic_mspct): generic_mspct

Note

If x is not a generic_spct or an object of a derived class NA is returned.

The method for collections of spectra returns the a tibble with the correct times in TZ = "UTC".

```

Examples

```
when_measured(sun.spct)
```

getWhereMeasured

Get the "where.measured" attribute

Description

Function to read the "where measured" attribute of generic_spct, generic_mspct, summary_generic_spct, data.frame or a derived-class object.

getWhereMeasured 175

Usage

```
getWhereMeasured(x, ...)
where_measured(x, ...)
## Default S3 method:
getWhereMeasured(x, ...)
## S3 method for class 'generic_spct'
getWhereMeasured(x, ...)
## S3 method for class 'summary_generic_spct'
getWhereMeasured(x, ...)
## S3 method for class 'generic_mspct'
getWhereMeasured(x, ..., idx = "spct.idx", .bind.geocodes = TRUE)
## S3 method for class 'data.frame'
getWhereMeasured(x, ...)
```

Arguments

x a generic_spct object... Allows use of additional arguments in methods for other classes.

idx character Name of the column with the names of the members of the collection

of spectra.

 $. \, bind. \, geocodes \, \, logical \, In \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, TRUE, \, the \, description \, and \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, = \, the \, case \, of \, collections \, of \, spectra \, if \, . \, bind. \, geocodes \, and \, collections \, of \, collections \, of \, spectra \, if \, collections \, of \, collection$

fault, the returned value is a single geocode with one row for each member spectrum. Otherwise the individual geocode data frames are returned in a list

column within a tibble.

Value

a data.frame with a single row and at least columns "lon" and "lat", unless expand is set to FALSE.

Methods (by class)

- getWhereMeasured(default): default
- getWhereMeasured(generic_spct): generic_spct
- getWhereMeasured(summary_generic_spct): summary_generic_spct
- getWhereMeasured(generic_mspct): generic_mspct
- getWhereMeasured(data.frame): data.frame

Note

If x is not a generic_spct or an object of a derived class NA is returned.

176 get_attributes

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhenMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrDesc(), trimInstrSettings()
```

Examples

```
where_measured(sun.spct)
```

get_attributes

Get the metadata attributes

Description

Method returning attributes of an object of class generic_spct or derived, or of class waveband. Only attributes defined and/or set by package 'photobiology' for objects of the corresponding class are returned. Parameter which can be used to subset the list of attributes.

Usage

```
get_attributes(x, which, ...)
## $3 method for class 'generic_spct'
get_attributes(x, which = NULL, allowed = all.attributes, ...)
## $3 method for class 'source_spct'
get_attributes(x, which = NULL, ...)
## $3 method for class 'filter_spct'
get_attributes(x, which = NULL, ...)
## $3 method for class 'reflector_spct'
get_attributes(x, which = NULL, ...)
## $3 method for class 'object_spct'
get_attributes(x, which = NULL, ...)
## $3 method for class 'solute_spct'
get_attributes(x, which = NULL, ...)
## $3 method for class 'waveband'
get_attributes(x, which = NULL, ...)
```

get_attributes 177

Arguments

x a generic_spct object.
 which character vector Names of attributes to retrieve.
 currently ignored
 allowed character vector Names of attributes accepted by which.

Details

Vectors of character strings passed as argument to which are parsed so that if the first member string is "-" the remaining members are removed from the allowed; and if it is "=" the remaining members are used if in allowed. If the first member is none of these three strings, the behaviour is the same as if the first string is "=". If which is NULL all the attributes in allowed are used. The string "" means no attributes, and has precedence over any other values in the character vector. The order of the names of annotations has no meaning: the vector is interpreted as a set except for the three possible "operators" at position 1.

Value

Named list of attribute values.

Methods (by class)

```
• get_attributes(generic_spct): generic_spct
```

• get_attributes(source_spct): source_spct

• get_attributes(filter_spct): filter_spct

• get_attributes(reflector_spct): reflector_spct

• get_attributes(object_spct): object_spct

• get_attributes(solute_spct): solute_spct

• get_attributes(waveband): waveband

```

178 get_peaks

get_peaks

Get peaks and valleys in a spectrum

Description

These functions find peaks (local maxima) or valleys (local minima) in a spectrum, using a user selectable size threshold relative to the tallest peak (global maximum). This a wrapper built on top of function peaks from package splus 2R.

Usage

```
get_peaks(
  х,
  у,
  ignore_threshold = 0,
  span = 5,
  strict = TRUE,
  x_unit = "",
  x_{digits} = 3,
  na.rm = FALSE
)
get_valleys(
  Х,
  у,
  ignore_threshold = 0,
  span = 5,
  strict = TRUE,
  x_unit = "",
  x_{digits} = 3,
  na.rm = FALSE
)
```

Arguments

X	numeric
У	numeric
ignore_thre	shold

numeric Value between 0.0 and 1.0 indicating the relative size compared to tallest peak threshold below which peaks will be ignored. Negative values set a threshold so that the tallest peaks are ignored, instead of the shortest.

span

integer A peak is defined as an element in a sequence which is greater than all other elements within a window of width span centered at that element. Use NULL for the global peak.

strict

logical If TRUE, an element must be strictly greater than all other values in its window to be considered a peak.

green_leaf.spct 179

x_unit	character Vector of texts to be pasted at end of labels built from x value at peaks.
x_digits	numeric Number of significant digits in wavelength label.
na.rm	logical indicating whether NA values should be stripped before searching for peaks.

Value

A data frame with variables w.length and s.irrad with their values at the peaks or valleys plus a character variable of labels.

See Also

```
Other peaks and valleys functions: find_peaks(), find_spikes(), peaks(), replace_bad_pixs(), spikes(), valleys(), wls_at_target()
```

Examples

```
with(sun.spct, get_peaks(w.length, s.e.irrad))
with(sun.spct, get_valleys(w.length, s.e.irrad))
```

green_leaf.spct

Green birch leaf reflectance.

Description

A dataset of spectral reflectance expressed as a fraction of one.

Usage

```
green_leaf.spct
```

Format

A reflector_spct object with 226 rows and 2 variables

Details

- w.length (nm)
- Rfr (0..1)

References

Aphalo, P. J. & Lehto, T. Effects of light quality on growth and N accumulation in birch seedlings Tree Physiology, 1997, 17, 125-132

180 head_tail

See Also

Other Spectral data examples: A.illuminant.spct, D50.illuminant.spct, D65.illuminant.spct, Ler_leaf.spct, black_body.spct, ccd.spct, clear.spct, filter_cps.mspct, phenylalanine.spct, photodiode.spct, sun_spct, sun_daily.spct, sun_evening.spct, two_filters.spct, two_sensors.mspct, water.spct, white_led.source_spct

Examples

```
green_leaf.spct
```

head_tail

Return the First and Last Parts of an Object

Description

Returns the first and last "parts" (rows or members) of a spectrum, dataframe, vector, function, table or ftable. In other words, the combined output from methods head and tail.

Usage

```
head_tail(x, n, ...)
## Default S3 method:
head_tail(x, n = 3L, ...)
## S3 method for class 'data.frame'
head_tail(x, n = 3L, ...)
## S3 method for class 'matrix'
head_tail(x, n = 3L, ...)
## S3 method for class '`function`'
head_tail(x, n = 6L, ...)
## S3 method for class 'table'
head_tail(x, n = 6L, ...)
## S3 method for class 'ftable'
head_tail(x, n = 6L, ...)
```

Arguments

```
x an R object.
```

n integer. If positive, n rows or members in the returned object are copied from each of "head" and "tail" of x. If negative, all except n elements of x from each of "head" and "tail" are returned.

arguments to be passed to or from other methods.

head_tail 181

Details

The value returned by head_tail() is equivalent to row binding the the values returned by head() and tail(), although not implemented in this way. The same specializations as defined in package 'utils' for head() and tail() have been implemented.

Value

An object (usually) like x but smaller, except when n = 0. For ftable objects x, a transformed format(x).

Methods (by class)

```
head_tail(default):
head_tail(data.frame):
head_tail(matrix):
head_tail(`function`):
head_tail(table):
head_tail(ftable):
```

Note

For some types of input, like functions, the output may be confusing, however, we have opted for consistency with existing functions. The code is in part a revision of that of head() and tail() from package 'utils'. This method is especially useful when checking spectral data, as both ends are of interest.

head_tail() methods for function, table and ftable classes, are wrappers for head() method.

See Also

head, and compare the examples and the values returned to the examples below.

head_tail(letters)
head_tail(sun.spct)
head_tail(sun.spct, 6)
head_tail(sun.data)
head_tail(sun.data)
head_tail(sun_evening.spct)
head_tail(sun_evening.mspct, 1L)
```

182 illuminance

illuminance

Irradiance

Description

Computes illuminance (lux), or the luminous flux incident on a surface, from spectral irradiance stored in a source_spct object.

Usage

```
illuminance(spct, std, scale.factor, allow.scaled, ...)
## Default S3 method:
illuminance(spct, std, scale.factor, allow.scaled, ...)
## S3 method for class 'source_spct'
illuminance(
  spct,
  std = "CIE2deg",
  scale.factor = 1,
 allow.scaled = FALSE,
 naming = "default",
)
## S3 method for class 'source_mspct'
illuminance(
  spct,
  std = "CIE2deg",
  scale.factor = 1,
 allow.scaled = FALSE,
 naming = "default",
  . . . ,
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct	an R object.
std	character The luminous efficiency function to use, "CIE2deg" or "CIE10deg".
scale.factor	numeric vector of length 1, or the character string exposure.
allow.scaled	logical indicating whether scaled or normalized spectra as argument to spct are flagged as an error.

illuminance 183

	other arguments (possibly ignored)
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
attr2tb	character vector, see ${\sf add_attr2tb}$ for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach.
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A named numeric vector of length one in the case of methods for individual spectra. A data.frame in the case of collections of spectra, containing one column with illuminance, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

The time.unit attribute is always second. Units are as follows: if time.unit of the argument passed to spct is second, $[W \text{ m-2 nm-1}] \rightarrow [lx]$, otherwise average value [lx] for the period unless exposure = TRUE.

Methods (by class)

- illuminance(default): Default for generic function
- illuminance(source_spct): Calculates illuminance from a source_spct object.
- illuminance(source_mspct): Calculates illuminance from a source_mspct object.

Note

Formal parameter allow. scaled is used internally for calculation of ratios, as rescaling and normalization do not invalidate the calculation of ratios within one spectrum.

```
illuminance(sun.spct)
illuminance(sun.daily.spct)
illuminance(sun.daily.spct, scale.factor = "exposure")
illuminance(sun.daily.spct, scale.factor = 1e-3)
```

184 insert_hinges

insert_hinges

Insert wavelength values into spectral data.

Description

Inserting wavelengths values immediately before and after a discontinuity in the SWF, greatly reduces the errors caused by interpolating the weighted irradiance during integration of the effective spectral irradiance. This is specially true when data have a large wavelength step size.

Usage

```
insert_hinges(x, y, h)
```

Arguments

x numeric vector (sorted in increasing order)

y numeric vector

h a numeric vector giving the wavelengths at which the y values should be inserted by interpolation, no interpolation is indicated by an empty vector (numeric(0))

Value

a data.frame with variables x and y. Unless the hinge values were already present in y, each inserted hinge, expands the vectors returned in the data frame by one value.

Note

Insertion is a costly operation but I have tried to optimize this function as much as possible by avoiding loops. Earlier this function was implemented in C++, but a bug was discovered and I have now rewritten it using R.

See Also

```

```

```
with(sun.data,
    insert_hinges(w.length, s.e.irrad,
        c(399.99, 400.00, 699.99, 700.00)))
```

insert_spct_hinges 185

insert_spct_hinges Ins	sert new wavelength values into a spectrum
------------------------	--

Description

Insert new wavelength values into a spectrum interpolating the corresponding spectral data values.

Usage

```
insert_spct_hinges(spct, hinges = NULL, byref = FALSE)
```

Arguments

spct an object of class "generic_spct"

hinges numeric vector of wavelengths (nm) at which the s.irrad should be inserted by

interpolation, no interpolation is indicated by an empty vector (numeric(0))

byref logical indicating if new object will be created by reference or by copy of spct

Value

a generic_spct or a derived type with variables w.length and other numeric variables.

Note

Inserting wavelengths values "hinges" immediately before and after a discontinuity in the SWF, greatly reduces the errors caused by interpolating the weighted irradiance during integration of the effective spectral irradiance. This is specially true when data has a large wavelength step size.

Examples

Description

This function gives the result of integrating spectral data over wavelengths.

Usage

```
integrate_spct(spct)
```

186 integrate_xy

Arguments

spct generic_spct

Value

One or more numeric values with no change in scale factor: e.g. [W m-2 nm-1] -> [W m-2]. Each value in the returned vector corresponds to a variable in the spectral object, except for wavelength. For non-numeric variables the returned value is NA.

Examples

```
integrate_spct(sun.spct)
```

integrate_xy

Gives irradiance from spectral irradiance.

Description

This function gives the result of integrating spectral irradiance over wavelengths.

Usage

```
integrate_xy(x, y)
```

Arguments

x numeric vector.
y numeric vector.

Value

a single numeric value with no change in scale factor: e.g. [W m-2 nm-1] -> [W m-2]

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

```
with(sun.data, integrate_xy(w.length, s.e.irrad))
```

187 interpolate_spct

interpolate_spct Map a spectrum to new wavelength values.

Description

This function gives the result of interpolating spectral data from the original set of wavelengths to a new one.

Usage

```
interpolate_spct(spct, w.length.out = NULL, fill = NA, length.out = NULL)
interpolate_mspct(
 mspct,
 w.length.out = NULL,
  fill = NA,
 length.out = NULL,
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct generic_spct

w.length.out numeric vector of wavelengths (nm)

fill a value to be assigned to out of range wavelengths

numeric value length.out

an object of class "generic_mspct" mspct

if TRUE, apply function in parallel, using parallel backend provided by foreach .parallel

a list of additional options passed into the foreach function when parallel compu-.paropts

> tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

If length out it is a numeric value, then gives the number of rows in the output, if it is NULL, the values in the numeric vector w.length.out are used. If both are not NULL then the range of w.length.out and length.out are used to generate a vector of wavelength. A value of NULL for fill prevents extrapolation. If both w.length.out and length.out are NULL the input is returned as is. If w.length.out has length equal to zero, zero rows from the input are returned.

Value

A new spectral object of the same class as argument spct.

interpolate_spectrum

Note

The default fill = NA fills extrapolated values with NA. Giving NULL as argument for fill deletes wavelengths outside the input data range from the returned spectrum. A numerical value can be also be provided as fill. This function calls interpolate_spectrum for each non-wavelength column in the input spectra object.

Examples

```
interpolate_spct(sun.spct, 400:500, NA)
interpolate_spct(sun.spct, 400:500, NULL)
interpolate_spct(sun.spct, seq(200, 1000, by=0.1), 0)
interpolate_spct(sun.spct, c(400,500), length.out=201)
```

interpolate_spectrum Calculate spectral values at a different set of wavelengths

Description

Interpolate/re-express spectral irradiance (or other spectral quantity) values at new wavelengths values. This is a low-level function operating on numeric vectors and called by higher level functions in the package, such as mathematical operators for classes for spectral data.

Usage

```
interpolate_spectrum(w.length.in, s.irrad, w.length.out, fill = NA, ...)
```

Arguments

```
w.length.in numeric vector of wavelengths (nm).
s.irrad a numeric vector of spectral values.
w.length.out numeric vector of wavelengths (nm).
fill a value to be assigned to out of range wavelengths.
... additional arguments passed to spline().
```

Value

a numeric vector of interpolated spectral values.

Note

The current version of interpolate uses spline if fewer than 25 data points are available. Otherwise it uses approx. In the first case a cubic spline is used, in the second case linear interpolation, which should be faster.

interpolate_wl 189

See Also

```
splinefun.
```

```
Other low-level functions operating on numeric vectors:: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

Examples

```
my.w.length <- 300:700
with(sun.data, interpolate_spectrum(w.length, s.e.irrad, my.w.length))</pre>
```

interpolate_wl

Map spectra to new wavelength values.

Description

This function returns the result of interpolating spectral data from the original set of wavelengths to a new one.

Usage

interpolate_wl

Arguments

x an R object
 w.length.out numeric vector of wavelengths (nm)
 fill a value to be assigned to out of range wavelengths
 length.out numeric value
 ... not used
 .parallel if TRUE, apply function in parallel, using parallel backend provided by foreach
 .paropts a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

If length.out it is a numeric value, then gives the number of rows in the output, if it is NULL, the values in the numeric vector w.length.out are used. If both are not NULL then the range of w.length.out and length.out are used to generate a vector of wavelength. A value of NULL for fill prevents extrapolation.

Value

A new spectral object of the same class as argument spct.

Methods (by class)

- interpolate_wl(default): Default for generic function
- interpolate_wl(generic_spct): Interpolate wavelength in an object of class "generic_spct" or derived.
- interpolate_wl(generic_mspct): Interpolate wavelength in an object of class "generic_mspct" or derived.

Note

The default fill = NA fills extrapolated values with NA. Giving NULL as argument for fill deletes wavelengths outside the input data range from the returned spectrum. A numerical value can be also be provided as fill. This function calls interpolate_spectrum for each non-wavelength column in the input spectra object.

```
interpolate_wl(sun.spct, 400:500, NA)
interpolate_wl(sun.spct, 400:500, NULL)
interpolate_wl(sun.spct, seq(200, 1000, by=0.1), 0)
interpolate_wl(sun.spct, c(400,500), length.out=201)
```

irrad 191

irrad

Irradiance

Description

This function returns the irradiance for a given waveband of a light source spectrum.

Usage

```
irrad(
  spct,
 w.band,
 unit.out,
 quantity,
  time.unit,
  scale.factor,
 wb.trim,
 use.cached.mult,
 use.hinges,
 allow.scaled,
)
## Default S3 method:
irrad(
  spct,
 w.band,
 unit.out,
 quantity,
  time.unit,
  scale.factor,
 wb.trim,
 use.cached.mult,
 use.hinges,
 allow.scaled,
)
## S3 method for class 'source_spct'
irrad(
  spct,
 w.band = NULL,
 unit.out = getOption("photobiology.radiation.unit", default = "energy"),
 quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
```

192 irrad

```
use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
 use.hinges = NULL,
  allow.scaled = !quantity %in% c("average", "mean", "total"),
 naming = "default",
 return.tb = FALSE,
)
## S3 method for class 'source_mspct'
irrad(
 spct,
 w.band = NULL,
 unit.out = getOption("photobiology.radiation.unit", default = "energy"),
 quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
 use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
 use.hinges = NULL,
  allow.scaled = !quantity %in% c("average", "mean", "total"),
 naming = "default",
 attr2tb = NULL,
 idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct	an R object.	
w.band	waveband or list of waveband objects The waveband(s) determine the region(s) of the spectrum that are summarized.	
unit.out	character Allowed values "energy", and "photon", or its alias "quantum".	
quantity	character string One of "total", "average" or "mean", "contribution", "contribution.pc", "relative" or "relative.pc".	
time.unit	character or lubridate::duration object.	
scale.factor	numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values.	
wb.trim	logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded.	
use.cached.mult		
	logical indicating whether multiplier values should be cached between calls.	
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands. If NULL, default is chosen based on data.	

irrad 193

allow.scaled	logical indicating whether scaled or normalized spectra as argument to spct are flagged as an error.
	other arguments (possibly ignored)
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
return.tb	logical Flag forcing a tibble to be always returned, even for a single spectrum as argumnet to spct. The default is FALSE for backwards compatibility.
attr2tb	character vector, see <pre>add_attr2tb</pre> for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach.
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A named numeric vector in the case of a _spct object containing a single spectrum and return.tb = FALSE. The vector has one member one value for each waveband passed to parameter w.band. In all other cases a tibble, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

If naming = "long" the names generated reflect both quantity and waveband, if naming = "short", names are based only on the wavebands, and if naming = "none" the returned vector has no names.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used. The time.unit attribute is copied from the spectrum object to the output. Units are as follows: If time.unit is second, [W m-2 nm-1] -> [mol s-1 m-2] or [W m-2 nm-1] -> [W m-2] If time.unit is day, [J d-1 m-2 nm-1] -> [mol d-1 m-2] or [J d-1 m-2 nm-1] -> [J m-2]

Methods (by class)

- irrad(default): Default for generic function
- irrad(source_spct): Calculates irradiance from a source_spct object.
- irrad(source_mspct): Calculates irradiance from a source_mspct object.

Note

Formal parameter allow. scaled is used internally for calculation of ratios, as rescaling and normalization do not invalidate the calculation of ratios.

194 irradiance

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

See Also

Other irradiance functions: e_fluence(), e_irrad(), fluence(), q_fluence(), q_irrad()

Examples

```
irrad(sun.spct, waveband(c(400,700)))
irrad(sun.spct, waveband(c(400,700)), "energy")
irrad(sun.spct, waveband(c(400,700)), "photon")
irrad(sun.spct, split_bands(c(400,700), length.out = 3))
irrad(sun.spct, split_bands(c(400,700), length.out = 3), quantity = "total")
irrad(sun.spct, split_bands(c(400,700), length.out = 3), quantity = "average")
irrad(sun.spct, split_bands(c(400,700), length.out = 3), quantity = "relative")
irrad(sun.spct, split_bands(c(400,700), length.out = 3), quantity = "relative.pc")
irrad(sun.spct, split_bands(c(400,700), length.out = 3), quantity = "contribution")
irrad(sun.spct, split_bands(c(400,700), length.out = 3), quantity = "contribution")
```

irradiance

Photon or energy irradiance from spectral energy or photon irradiance.

Description

Energy or photon irradiance for one or more wavebands of a radiation spectrum.

Usage

```
irradiance(
   w.length,
   s.irrad,
   w.band = NULL,
   unit.out = NULL,
   unit.in = "energy",
   check.spectrum = TRUE,
   use.cached.mult = FALSE,
   use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

irradiance 195

Arguments

w.length	numeric Vector of wavelength $[nm]$.	
s.irrad	numeric vector of spectral (energy) irradiances $[W m^{-2} nm^{-1}]$.	
w.band	waveband or list of waveband objects The waveband(s) determine the region(s) of the spectrum that are summarized.	
unit.out, unit.in		
	character Allowed values "energy", and "photon", or its alias "quantum".	
check.spectrum	logical Flag indicating whether to sanity check input data, default is TRUE.	
use.cached.mult		
	logical Flag indicating whether multiplier values should be cached between calls.	
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.	

Value

A single numeric value or a vector of numeric values with no change in scale factor: $[mol\ s^{-1}\ sm^{-2}\ nm^{-1}]$ yields $[mol\ s^{-1}\ sm^{-2}]$

Note

The last three parameters control speed optimizations. The defaults should be suitable in most cases. If you set check.spectrum=FALSE then you should call check_spectrum() at least once for your spectrum before using any of the other functions. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector. The is no reason for setting use.cpp.code=FALSE other than for testing the improvement in speed, or in cases where there is no suitable C++ compiler for building the package.

```

```
with(sun.data, irradiance(w.length, s.e.irrad, new_waveband(400,700), "photon"))
```

is.generic_mspct

is.generic_mspct

Query class of spectrum objects

Description

Functions to check if an object is of a given type of spectrum, or coerce it if possible.

Usage

```
is.generic_mspct(x)
is.calibration_mspct(x)
is.raw_mspct(x)
is.cps_mspct(x)
is.cps_mspct(x)
is.source_mspct(x)
is.response_mspct(x)
is.filter_mspct(x)
is.reflector_mspct(x)
is.object_mspct(x)
is.solute_mspct(x)
is.chroma_mspct(x)
```

Arguments

x an R object.

Value

These functions return TRUE if its argument is a of the queried type of spectrum and FALSE otherwise.

Note

Derived types also return TRUE for a query for a base type such as generic_mspct.

is.generic_spct 197

Examples

```
my.mspct <- filter_mspct(list(polyester.spct, yellow_gel.spct))
is.any_mspct(my.mspct)
is.filter_mspct(my.mspct)
is.source_mspct(my.mspct)</pre>
```

is.generic_spct

Query class of spectrum objects

Description

Functions to query whether an object is of a given type of spectrum.

Usage

```
is.generic_spct(x)
is.raw_spct(x)
is.calibration_spct(x)
is.cps_spct(x)
is.source_spct(x)
is.response_spct(x)
is.filter_spct(x)
is.reflector_spct(x)
is.object_spct(x)
is.solute_spct(x)
is.chroma_spct(x)
```

Arguments

x an R object.

Value

A logical value, TRUE if the argument passed to x is an object of the queried type of spectrum and FALSE otherwise.

is.old_spct

Note

Derived types also return TRUE for a query for a base type such as generic_spct, following R's practice.

Examples

```
is.source_spct(sun.spct)
is.filter_spct(sun.spct)
is.generic_spct(sun.spct)
is.generic_spct(sun.spct)
is.source_spct(sun.spct)
is.filter_spct(sun.spct)
is.generic_spct(sun.spct)
is.generic_spct(sun.spct)
```

is.old_spct

Query if an object has old class names

Description

Query if an object has old class names Query if an object has old class names as used in photobiology (>= 0.6.0).

Usage

```
is.old_spct(object)
```

Arguments

object

an R object

Value

logical

See Also

Other upgrade from earlier versions: upgrade_spct(), upgrade_spectra()

```
is.summary_generic_spct
```

Query class of spectrum summary objects

Description

Functions to check if an object is of a given type of spectrum, or coerce it if possible.

Usage

```
is.summary_generic_spct(x)
is.summary_raw_spct(x)
is.summary_cps_spct(x)
is.summary_source_spct(x)
is.summary_response_spct(x)
is.summary_filter_spct(x)
is.summary_reflector_spct(x)
is.summary_object_spct(x)
is.summary_solute_spct(x)
is.summary_solute_spct(x)
is.summary_chroma_spct(x)
```

Arguments

x an R object.

Value

These functions return TRUE if its argument is a of the queried type of spectrum and FALSE otherwise.

Note

Derived types also return TRUE for a query for a base type such as generic_spct.

200 is ValidInstrDesc

Examples

```
sm <- summary(sun.spct)
is.summary_source_spct(sm)</pre>
```

is.waveband

Query if it is a waveband

Description

Functions to check if an object is waveband.

Usage

```
is.waveband(x)
```

Arguments

Х

any R object

Value

is.waveband returns TRUE if its argument is a waveband and FALSE otherwise.

isValidInstrDesc

Check the "instr.desc" attribute

Description

Function to validate the "instr.settings" attribute of an existing generic_spct object.

Usage

```
isValidInstrDesc(x)
```

Arguments

Χ

a generic_spct object

Value

logical TRUE if at least instrument name and serial number is found.

is ValidInstrSettings 201

See Also

Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrSettings(), select_spct_attributes(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhenMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()

 $is {\tt ValidInstrSettings} \quad \textit{Check the "instr.settings" attribute}$

Description

Function to validate the "instr.settings" attribute of an existing generic_spct object.

Usage

```
isValidInstrSettings(x)
```

Arguments

x a generic_spct object

Value

logical TRUE if at least integration time data is found.

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), select_spct_attributes(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhenMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

202 is_absorbance_based

is_absorbance_based

Query if a spectrum contains absorbance or transmittance data

Description

Functions to query if an filter spectrum contains spectral absorbance data or spectral transmittance data.

Usage

```
is_absorbance_based(x)
is_absorptance_based(x)
is_transmittance_based(x)
```

Arguments

Х

an R object

Value

is_absorbance_based returns a logical value, TRUE if its argument is a filter_spct object that contains spectral absorbance data and FALSE otherwise, but returns NA for any other R object, including those belonging other generic_spct-derived classes.

is_absorptance_based returns a logical value, if its argument is a filter_spct object, TRUE if it contains data as spectral absorptance and FALSE otherwise, but returns NA for any other R object, including those belonging other generic_spct-derived classes.

is_transmittance_based returns TRUE if its argument is a filter_spct object that contains spectral transmittance data and FALSE if it does not contain such data, but returns NA for any other R object, including those belonging other generic_spct-derived classes.

See Also

Other query units functions: is_mole_based(), is_photon_based()

```
is_absorbance_based(polyester.spct)
my.spct <- T2A(polyester.spct)
is.filter_spct(my.spct)
is_absorbance_based(my.spct)
is_absorptance_based(polyester.spct)
is_transmittance_based(polyester.spct)</pre>
```

is_effective 203

is_effective

Is an R object "effective"

Description

A generic function for querying if a biological spectral weighting function (BSWF) has been applied to an object or is included in its definition.

Usage

```
is_effective(x)
## Default S3 method:
is_effective(x)
## S3 method for class 'waveband'
is_effective(x)
## S3 method for class 'generic_spct'
is_effective(x)
## S3 method for class 'source_spct'
is_effective(x)
## S3 method for class 'summary_generic_spct'
is_effective(x)
## S3 method for class 'summary_source_spct'
is_effective(x)
```

Arguments

Х

an R object

Value

A logical.

Methods (by class)

- is_effective(default): Default method.
- is_effective(waveband): Is a waveband object defining a method for calculating effective irradiance.
- is_effective(generic_spct): Does a source_spct object contain effective spectral irradiance values.
- is_effective(source_spct): Does a source_spct object contain effective spectral irradiance values.

is_mole_based

- is_effective(summary_generic_spct): Method for "summary_generic_spct".
- is_effective(summary_source_spct): Method for "summary_source_spct".

See Also

Other waveband attributes: labels(), normalization()

Examples

```
is_effective(summary(sun.spct))
```

is_mole_based

Query if a spectrum contains mole or mass based data

Description

Functions to check if an solute attenuation spectrum contains coefficients on expressed on mole of mass base.

Usage

```
is_mole_based(x)
is_mass_based(x)
```

Arguments

Х

an R object

Value

is_mole_based returns TRUE if its argument is a solute_spct object that contains spectral K.mole data and FALSE if it contains K.mass data, but returns NA for any other R object, including those belonging other generic_spct-derived classes. is_mass_based returns the complement of is_mole_based.

See Also

```
Other query units functions: is_absorbance_based(), is_photon_based()
```

```
print("missing example")
```

is_normalized 205

is_normalized

Query whether a generic spectrum has been normalized.

Description

This function tests a generic_spct object for an attribute that signals whether the spectral data has been normalized or not after the object was created.

Usage

```
is_normalized(x)
is_normalised(x)
```

Arguments

Х

An R object.

Value

A logical value indicating if x is normalized or not, for collections of spectra, a named list with logicals as members. If x is not a generic_spct or generic_mspct object the value returned is NA.

Note

is_normalised() is a synonym for this is_normalized() method.

See Also

Other rescaling functions: fscale(), fshift(), getNormalized(), getScaled(), is_scaled(), normalize(), setNormalized(), setScaled()

is_photon_based

Query if a spectrum contains photon- or energy-based data.

Description

Functions to query if source_spct and response_spct objects contain photon-based or energy-based data.

Usage

```
is_photon_based(x)
is_energy_based(x)
```

is_scaled is_scaled

Arguments

Х

any R object

Value

is_photon_based returns a logical value, TRUE if its argument is a source_spct or a response_spct object that contains photon base data and FALSE otherwise, but returns NA for any other R object, including those belonging other generic_spct-derived classes.

is_energy_based returns a logical value, TRUE if its argument is a source_spct or a response_spct object that contains energy base data and FALSE otherwise, but returns NA for any other R object, including those belonging other generic_spct-derived classes

See Also

Other query units functions: is_absorbance_based(), is_mole_based()

Examples

```
colnames(sun.spct)
is_photon_based(sun.spct)
my.spct <- sun.spct[ , c("w.length", "s.e.irrad")]
is.source_spct(my.spct)
is_photon_based(my.spct)

colnames(sun.spct)
is_energy_based(sun.spct)
my.spct <- sun.spct[ , c("w.length", "s.q.irrad")]
is.source_spct(my.spct)
is_energy_based(my.spct)</pre>
```

is_scaled

Query whether a generic spectrum has been scaled

Description

This function tests a generic_spct object for an attribute that signals whether the spectral data has been rescaled or not after the object was created.

Usage

```
is_scaled(x)
```

Arguments

Χ

An R object.

is_tagged 207

Value

A logical value. If x is not scaled or x is not a generic_spct object the value returned is FALSE.

See Also

```
Other rescaling functions: fscale(), fshift(), getNormalized(), getScaled(), is_normalized(), normalize(), setNormalized(), setScaled()
```

Examples

```
scaled.spct <- fscale(sun.spct)
is_scaled(sun.spct)
is_scaled(scaled.spct)</pre>
```

is_tagged

Query if a spectrum is tagged

Description

Functions to check if an spct object contains tags.

Usage

```
is_tagged(x)
```

Arguments

Χ

any R object

Value

is_tagged returns a logical value, TRUE if its argument is a a spectrum that contains tags and FALSE if it is an untagged spectrum, but returns NA for any other R object.

See Also

```
Other tagging and related functions: tag(), untag(), wb2rect_spct(), wb2spct(), wb2tagged_spct()
```

```
is_tagged(sun.spct)
```

208 join_mspct

join_mspct

Join all spectra in a collection

Description

Join all the spectra contained in a homogeneous collection, returning a data frame with spectraldata columns named according to the names of the spectra in the collection. By default a full join is done within the overlapping range of wavelengths, after interpolating the spectra to a shared set of wavelength values, and discarding data for wavelength not shared. Alternatively, filling the spectral data for wavelengths outside the overlapping range with with NA when data is not available.

Usage

```
join_mspct(x, type, ...)
## Default S3 method:
join_mspct(x, type = "full", ...)
## S3 method for class 'generic_mspct'
join_mspct(x, type = "full", col.name, validate.names = TRUE, ...)
## S3 method for class 'source_mspct'
join_mspct(x, type = "full", unit.out = "energy", validate.names = TRUE, ...)
## S3 method for class 'response_mspct'
join_mspct(x, type = "full", unit.out = "energy", validate.names = TRUE, ...)
## S3 method for class 'filter_mspct'
join_mspct(
 х,
  type = "full",
  qty.out = "transmittance",
  validate.names = TRUE,
)
## S3 method for class 'reflector_mspct'
join_mspct(x, type = "full", validate.names = TRUE, ...)
## S3 method for class 'object_mspct'
join_mspct(x, type = "full", qty.out, validate.names = TRUE, ...)
## S3 method for class 'solute_mspct'
join_mspct(x, type = "full", validate.names = TRUE, ...)
```

Arguments

x generic_mspct object, or an object of a class derived from generic_mspct.

join_mspct 209

type	character Type of join: "inner" (default) or "full". See details for more information.
	ignored (possibly used by derived methods).
col.name	character, name of the column in the spectra to be preserved, in addition to "w.length".
validate.names	logical A flag to enable (default) or disable validation of column names with make.names.
unit.out	character Allowed values "energy", and "photon", or its alias "quantum".
qty.out	character Allowed values "transmittance", "absorptance", and "absorbance" and in the method for object_spct, also "reflectance" (.

Value

A data.frame with the spectra joined by, possibly interpolated, wavelength, with rows sorted by wavelength (variable w.length) and data columns named according to the names of members in x, by default made unique and valid.

Methods (by class)

```
join_mspct(default):
join_mspct(generic_mspct):
join_mspct(source_mspct):
join_mspct(response_mspct):
join_mspct(filter_mspct):
join_mspct(reflector_mspct):
join_mspct(object_mspct):
join_mspct(solute_mspct):
```

Note

Currently only generic_spct, source_mspct, response_mspct, filter_mspct, reflector_mspct, object_mspct and solute_mspct classes have this method implemented.

```
my.mspct <- solute_mspct(list(water = water.spct, pha = phenylalanine.spct))
join_mspct(my.mspct, type = "inner")
join_mspct(my.mspct, type = "full")</pre>
```

210 Ler_leaf.spct

labels

Find labels from "waveband" object

Description

A method specialization that extracts the name and label of objects of class waveband.

Usage

```
## S3 method for class 'waveband'
labels(object, ...)
## S3 method for class 'generic_spct'
labels(object, ...)
```

Arguments

```
object an object of class "waveband"
... not used in current version
```

Methods (by class)

• labels(generic_spct):

See Also

```
Other waveband attributes: is_effective(), normalization()
```

Examples

```
labels(sun.spct)
```

Ler_leaf.spct

Green Arabidopsis leaf reflectance and transmittance.

Description

A dataset of total spectral reflectance and total spectral transmittance expressed as fractions of one from the upper surface of a leaf of an Arabidopsis thaliana 'Ler' rosette.

Ler_leaf.spct 211

Usage

```
Ler_leaf.spct
Ler_leaf_rflt.spct
Ler_leaf_trns.spct
Ler_leaf_trns_i.spct
```

Format

Datasets stored as object_spct, reflector_spct and filter_spct objects, containing transmittance and reflectance data.

An object of class reflector_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 1750 rows and 2 columns.

An object of class filter_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 1753 rows and 2 columns.

An object of class filter_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 2401 rows and 3 columns.

Details

- w.length (nm)
- Rfr (0..1)
- Tfr (0..1)

Note

Measured with a Jaz spectrometer from Ocean Optics (USA) configured with a PX Xenon lamp module and Spectroclip double integrating spheres.

Author(s)

```
Aphalo, P. J. & Wang, F (unpublished data)
```

Ler_leaf_rflt.spct
```

212

log

Logarithms and Exponentials

Description

Logarithms and Exponentials for Spectra. The functions are applied to the spectral data, not the wavelengths. The quantity in the spectrum to which the function is applied depends on the class of x and the current value of output options

log

Usage

```
## S3 method for class 'generic_spct'
log(x, base = exp(1))

## S3 method for class 'generic_spct'
log2(x)

## S3 method for class 'generic_spct'
log10(x)

## S3 method for class 'generic_spct'
exp(x)
```

Arguments

```
x an object of class "generic_spct"

base a positive number: the base with respect to which logarithms are computed.

Defaults to e=exp(1).
```

Value

An object of the same class as x.

Note

In most cases a logarithm of an spectral quantity will yield off-range values. For this reason unless x is an object of base class generic_spct, checks will not be passed, resulting in warnings or errors.

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), convolve_each(), div-.generic_spct, minus-.generic_spct, mod-.generic_spct, plus-.generic_spct, round(), sign(), slash-.generic_spct, times-.generic_spct
```

make_var_labels 213

make_var_labels

Column or variable labels

Description

Create a named list of character strings describing the variables contained in a spectrum object.

Usage

```
make_var_labels(x, ...)
## Default S3 method:
make_var_labels(x, ...)
## S3 method for class 'source_spct'
make_var_labels(x, ...)
## S3 method for class 'response_spct'
make_var_labels(x, ...)
## S3 method for class 'filter_spct'
make_var_labels(x, ...)
## S3 method for class 'reflector_spct'
make_var_labels(x, ...)
## S3 method for class 'object_spct'
make_var_labels(x, ...)
## S3 method for class 'solute_spct'
make_var_labels(x, ...)
## S3 method for class 'chroma_spct'
make_var_labels(x, ...)
## S3 method for class 'calibration_spct'
make_var_labels(x, ...)
## S3 method for class 'raw_spct'
make_var_labels(x, ...)
## S3 method for class 'cps_spct'
make_var_labels(x, ...)
```

Arguments ×

An object of a class derived from generic_spct.

214 make_var_labels

... Currently ignored.

Details

Objects of classes derived from <code>generic_spct</code> are used to store different types of spectral data. The data stored in some of the classes needs to be interpreted differently depending on how they were measured or are expressed and this information is stored in attributes of the objects. In other cases, even if consistent across different objects, the units of expression may not be obvious to users. The names of the variables are concise, thus using variable labels makes it possible to make these features visible when exploring the data. The methods provided do not add the labels, only supply the character strings. Variable labels are implemented in packages 'labelled' by setting the label attribute in each variable (= column) of a data frame or tibble. This is compatible with the approach used by package 'haven'.

Value

A named list of character strings with one member for each recognized column in x. This list can be used to set variable labels with methods from package 'labelled'. However, package 'photobiology' does not natively support variable labels stored in attribute label.

Methods (by class)

```
make_var_labels(default):
make_var_labels(source_spct):
make_var_labels(response_spct):
make_var_labels(filter_spct):
make_var_labels(reflector_spct):
make_var_labels(object_spct):
make_var_labels(solute_spct):

```

MathFun

Miscellaneous Mathematical Functions

Description

abs(x) computes the absolute value of x, sqrt(x) computes the (principal) square root of x. The functions are applied to the spectral data, not the wavelengths. The quantity in the spectrum to which the function is applied depends on the class of x and the current value of output options.

Usage

```
## S3 method for class 'generic_spct'
sqrt(x)
## S3 method for class 'generic_spct'
abs(x)
```

Arguments

Χ

an object of class "generic_spct"

See Also

```
Other math operators and functions: ^.generic_spct(), convolve_each(), div-.generic_spct, log(), minus-.generic_spct, mod-.generic_spct, plus-.generic_spct, round(), sign(), slash-.generic_spct, times-.generic_spct
```

merge2object_spct

Merge into object_spct

Description

Merge a filter_spct with a reflector_spct returning an object_spct object, even if wavelength values are mismatched.

216 merge_attributes

Usage

```
merge2object_spct(
    x,
    y,
    by = "w.length",
    ...,
    w.length.out = x[["w.length"]],
    Tfr.type.out = "total"
)
```

Arguments

Value

An object_spct is returned as the result of merging a filter_spct and a reflector_spct object.

Note

If a numeric vector is supplied as argument for w.length.out, the two spectra are interpolated to the new wavelength values before merging. The default argument for w.length.out is x[["w.length"]].

See Also

join

merge_attributes

Merge and copy attributes

Description

Merge attributes from x and y and copy them to z. Methods defined for spectral objects of classes from package 'photobiology'.

minus-.generic_spct 217

Usage

```
merge_attributes(x, y, z, which, which.not, ...)
## Default S3 method:
merge_attributes(x, y, z, which = NULL, which.not = NULL, ...)
## S3 method for class 'generic_spct'
merge_attributes(
    x,
    y,
    z,
    which = NULL,
    which.not = NULL,
    copy.class = FALSE,
    ...
)
```

Arguments

x, y, z	R objects. Objects x and y must be of the same class, z must be an object with a structure valid for this same class.
which	character Names of attributes to copy, if NULL all those relevant according to the class of x are used as default,
which.not	character Names of attributes not to be copied. The names passed here are removed from the list for which, which is most useful when we want to modify the default.
	not used
copy.class	logical If TRUE class attributes are also copied.

Value

A copy of z with additional attributes set.

Methods (by class)

- merge_attributes(default): Default for generic function
- merge_attributes(generic_spct):

```
minus-.generic_spct Arithmetic Operators
```

Description

Subtraction operator for generic spectra.

218 mod-.generic_spct

Usage

```
## S3 method for class 'generic_spct'
e1 - e2 = NULL
```

Arguments

```
e1 an object of class "generic_spct"
e2 an object of class "generic_spct"
```

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), convolve_each(), div-.generic_spct, log(), mod-.generic_spct, plus-.generic_spct, round(), sign(), slash-.generic_spct, times-.generic_spct
```

mod-.generic_spct

Arithmetic Operators

Description

Reminder operator for generic spectra.

Usage

```
## S3 method for class 'generic_spct'
e1 %% e2
```

Arguments

```
e1 an object of class "generic_spct"
e2 an object of class "generic_spct"
```

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), convolve_each(), div-.generic_spct, log(), minus-.generic_spct, plus-.generic_spct, round(), sign(), slash-.generic_spct, times-.generic_spct
```

msmsply 219

msmsply

Multi-spct transform methods

Description

Apply a function or operator to a collection of spectra.

Usage

```
msmsply(mspct, .fun, ..., .parallel = FALSE, .paropts = NULL)

msdply(
    mspct,
    .fun,
    ...,
    idx = NULL,
    col.names = NULL,
    .parallel = FALSE,
    .paropts = NULL
)

mslply(mspct, .fun, ..., .parallel = FALSE, .paropts = NULL)

msaply(mspct, .fun, ..., .drop = TRUE, .parallel = FALSE, .paropts = NULL)
```

Arguments

mspct	an object of class generic_mspct or a derived class
.fun	a function
	other arguments passed to .fun
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.
idx	character Name of the column with the names of the members of the collection of spectra.
col.names	character Names to be used for data columns.
.drop	should extra dimensions of length 1 in the output be dropped, simplifying the output. Defaults to TRUE

220 na.omit

Value

a collection of spectra in the case of msmsply, belonging to a different class than mspct if . fun modifies the class of the member spectra.

a data frame in the case of msdply

a list in the case of mslply

an vector in the case of msaply

mspct_classes

Names of multi-spectra classes

Description

Function that returns a vector containing the names of multi-spectra classes using for collections of spectra.

Usage

```
mspct_classes()
```

Value

A character vector of class names.

Examples

```
mspct_classes()
```

na.omit

Handle Missing Values in Objects

Description

These methods are useful for dealing with NAs in e.g., source_spct, response_spct, filter_spct and reflector_spct.

na.omit 221

Usage

```
## S3 method for class 'generic_spct'
na.omit(object, na.action = "omit", fill = NULL, target.colnames, ...)
## S3 method for class 'source_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'response_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'filter_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'reflector_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'object_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'solute_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'cps_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'raw_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'chroma_spct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'generic_mspct'
na.omit(object, na.action = "omit", fill = NULL, ...)
## S3 method for class 'generic_spct'
na.exclude(object, na.action = "exclude", fill = NULL, target.colnames, ...)
## S3 method for class 'source_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
## S3 method for class 'response_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
## S3 method for class 'filter_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
## S3 method for class 'reflector_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
```

222 na.omit

```
## S3 method for class 'object_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
## S3 method for class 'solute_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
## S3 method for class 'cps_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
## S3 method for class 'raw_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
## S3 method for class 'chroma_spct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
## S3 method for class 'generic_mspct'
na.exclude(object, na.action = "exclude", fill = NULL, ...)
```

Arguments

object an R object

na.action character One of "omit", "exclude" or "replace".

fill numeric Value used to replace NAs unless NULL, in which case interpolation is

attempted.

target.colnames

character Vector of names for the target columns to operate upon, if present in

object.

... further arguments other special methods could require

Details

If na.omit removes cases, the row numbers of the cases form the "na.action" attribute of the result, of class "omit".

na.exclude differs from na.omit only in the class of the "na.action" attribute of the result, which is "exclude".

Note

na.fail and na.pass do not require a specialisation for spectral objects. R's definitions work as expected with no need to override them. We do not define a method na.replace, just pass "replace" as argument. The current implementation replaces by interpolation only individual NAs which are flanked on both sides by valid data. Runs of multiple NAs con only replaced by a constant value passed through parameter fill.

See Also

```
na.fail and na.action
```

normalization 223

Examples

```
my_sun.spct <- sun.spct</pre>
my_sun.spct[3, "s.e.irrad"] <- NA</pre>
my_sun.spct[5, "s.q.irrad"] <- NA</pre>
head(my_sun.spct)
# rows omitted
zo <- na.omit(my_sun.spct)</pre>
head(zo)
na.action(zo)
# rows excluded
ze <- na.exclude(my_sun.spct)</pre>
head(ze)
na.action(ze)
# data in both rows replaced
zr <- na.omit(my_sun.spct, na.action = "replace")</pre>
head(zr)
na.action(zr)
```

normalization

Normalization of an R object

Description

Normalization wavelength [nm] and other normalization metadata of an R object, retrieved from the object's attributes.

Usage

```
normalization(x)
## Default S3 method:
normalization(x)
## S3 method for class 'waveband'
normalization(x)
## S3 method for class 'generic_spct'
normalization(x)
## S3 method for class 'summary_generic_spct'
normalization(x)
## S3 method for class 'generic_mspct'
normalization(x)
```

224 normalization

Arguments

x an R object

Details

In the case of wavebands for spectral weighting functions (waveband objects), the normalization wavelength is returned. For spectral objects (generic_spct and derived), the normalization descriptor, a list object, is returned. This list contains in addition to the normalization wavelength, the multiplier used and type of normalization applied. These metadata makes it possible to "undo" the normalization and to "update" the normalization after a transformation, such as conversion to a related physical quantity, of the spectral data.

Value

A single numeric value of wavelength [nm] or a list with with members.

Methods (by class)

- normalization(default): Default methods.
- normalization(waveband): Normalization of a waveband object.
- normalization(generic_spct): Normalization of a generic_spct object.
- normalization(summary_generic_spct): Normalization of a summary.generic_spct object.
- normalization(generic_mspct): Normalization of a generic_mspct object.

Note

Older versions of the package stored only a subset of the metadata or only a flag to indicate that normalization had been applied. For such objects some or even all fields in the returned list are set to NA.

See Also

Other waveband attributes: is_effective(), labels()

```
is_normalized(sun.spct)
normalization(sun.spct)
sun_norm.spct <- normalize(sun.spct)
is_normalized(sun_norm.spct)
normalization(sun_norm.spct)

my_wband <- waveband(c(400,700))
is_normalized(my_wband)
normalization(my_wband)</pre>
```

normalize

Normalize spectral data

Description

This method returns a spectral object of the same class as the one supplied as argument but with the spectral data normalized to 1.0 at a specific wavelength. When the object contains multiple spectra, the normalisation is applied to each spectrum individually.

Usage

```
normalize(x, ...)
normalise(x, ...)
## Default S3 method:
normalize(x, ...)
## S3 method for class 'source_spct'
normalize(
  х,
  range = NULL,
  norm = "max",

## S3 method for class 'generic_mspct'
normalize(
    x,
    ...,
    range = NULL,
    norm = "max",
    col.names,
    keep.scaling = FALSE,
    na.rm = FALSE,
    .parallel = FALSE,
    .paropts = NULL
)
```

Arguments

x An R object

... not used in current version

range An R object on which range() returns a numeric vector of length 2 with the

limits of a range of wavelengths in nm, with min and max wavelengths (nm)

used to set boundaries for search for normalization.

norm numeric Normalization wavelength (nm) or character string "max", or "min" for

normalization at the corresponding wavelength, "update" to update the normalization after modifying units of expression, quantity or range but respecting the previously used criterion, "undo" to revert an existing normalization or "skip" to

force return of x unchanged.

unit.out No longer supported and is ignored with a warning.

keep.scaling logical or numeric Flag to indicate if any existing scaling should be preserved

or not. The default, FALSE, preserves the behaviour of versions (\leq 0.10.9). If numeric, the spectrum is scaled to this value before normalization and marked

as not scaled.

na.rm logical indicating whether NA values should be stripped before calculating the

summary (e.g. "max") used for normalization.

qty.out No longer supported and is ignored with a warning...

col.names character vector containing the names of columns or variables. Columns in x

matching the names in col.names are normalized, other columns are returned

unchanged.

.parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

By default normalization is done based on the maximum of the spectral data. It is possible to also do the normalization based on a user-supplied wavelength expressed in nanometres or the minimum. An existing normalization can be updated for a different unit of expression or after a conversion to a related spectral quantity.

By default the function is applied to the whole spectrum, but by passing a range of wavelengths as input, the search, e.g., for the maximum, can be limited to a range of wavelengths of interest instead of the whole spectrum.

In 'photobiology' (>= 0.10.8) detailed information about the normalization is stored in an attribute. In 'photobiology' (>= 0.10.10) applying a new normalization to an already normalized spectrum recomputes the multiplier factors stored in the attributes whenever possible. This ensures that the returned object is identical, except for possible accumulated loss of precision due to floating-point arithmetic, independently of the previous application of a different normalization.

Value

A copy of the object passed as argument to x with the values of the spectral quantity rescaled to 1 at the normalization wavelength. If the normalization wavelength is not already present in x, it is added by interpolation—i.e. the returned value may be one row longer than x. Attributes normalized and normalization are set to keep a log of the computations applied.

Methods (by class)

- normalize(default): Default for generic function
- normalize(source_spct): Normalize a source_spct object.
- normalize(response_spct): Normalize a response spectrum.
- normalize(filter_spct): Normalize a filter spectrum.
- normalize(reflector_spct): Normalize a reflector spectrum.
- normalize(solute_spct): Normalize a solute spectrum.
- normalize(raw_spct): Normalize a raw spectrum.
- normalize(cps_spct): Normalize a cps spectrum.
- normalize(generic_spct): Normalize a raw spectrum.
- normalize(source_mspct): Normalize the members of a source mspct object.
- normalize(response_mspct): Normalize the members of a response_mspct object.
- normalize(filter_mspct): Normalize the members of a filter_mspct object.
- normalize(reflector_mspct): Normalize the members of a reflector_mspct object.
- normalize(raw_mspct): Normalize the members of a raw_mspct object.
- normalize(cps_mspct): Normalize the members of a cps_mspct object.
- normalize(solute_mspct): Normalize the members of a solute_mspct object.
- normalize(generic_mspct): Normalize the members of a solute_mspct object.

normalized_diff_ind 231

Note

When the spectrum passed as argument to x had been previously scaled, in 'photobiology' (\leq 0.10.9) the scaling attribute was always removed and no normalization factors returned. In 'photobiology' (\geq 0.10.10) scaling information can be preserved by passing keep.scaling = TRUE.

By default if x contains one or more NA values and the normalization is based on a summary quantity, the returned spectrum will contain only NA values. If na.rm == TRUE then the summary quantity will be calculated after striping NA values, and only the values that were NA in x will be NA values in the returned spectrum.

When a numeric value is passed as argument to keep.scaling, the scaling uses f = "total" or f = "mean" depending on the class of x. Prescaling is only occasionally needed.

Method normalize is implemented for solute_spct objects but as the spectral data stored in them are a description of an intensive property of a substance, normalization is unlikely to useful. To represent solutions of specific concentrations of solutes, filter_spct objects should be used instead. normalise() is a synonym for this normalize() method.

See Also

```
Other rescaling functions: fscale(), fshift(), getNormalized(), getScaled(), is_normalized(), is_scaled(), setNormalized(), setScaled()
```

Examples

```
normalize(sun.spct)
normalise(sun.spct) # equivalent
normalize(sun.spct, norm = "max")
normalize(sun.spct, norm = 400)
```

normalized_diff_ind Calculate a normalized difference.

Description

This method returns a normalized difference index value for an arbitrary pair of wavebands. There are many such indexes in use, such as NDVI (normalized difference vegetation index), NDWI (normalized difference water index), NDMI (normalized difference moisture index), etc., the only difference among then is in the wavebands used.

Usage

```
normalized_diff_ind(spct, w.band.plus, w.band.minus, f, ...)
normalised_diff_ind(spct, w.band.plus, w.band.minus, f, ...)
NDxI(spct, w.band.plus, w.band.minus, f, ...)
```

232 normalized_diff_ind

```
## Default S3 method:
normalized_diff_ind(spct, w.band.plus, w.band.minus, f, ...)
## S3 method for class 'generic_spct'
normalized_diff_ind(spct, w.band.plus, w.band.minus, f, ...)
## S3 method for class 'generic_mspct'
normalized_diff_ind(spct, w.band.plus, w.band.minus, f, ...)
```

Arguments

spct an R object
w.band.plus, w.band.minus

waveband objects The wavebands determine the regions of the spectrum used in the calculations.

f function used for integration taking spct as first argument and a list of wavebands as second argument.

... additional arguments passed to f

Details

f is most frequently reflectance, but also transmittance, or even absorbance, response, irradiance or a user-defined function can be used if there is a good reason for it. In every case spct should be of the class expected by f. When using two wavebands of different widths do consider passing to f a suitable quantity argument, for example to compare averages rather than integrals. Wavebands can describe weighting functions if desired.

$$NDxI = \frac{f(s, wb_{plus}) - f(s, wb_{minus})}{f(s, wb_{plus}) + f(s, wb_{minus})}$$

Value

A named numeric value for the index, or a tibble depending on whether a spectrum or a collection of spectra is passed as first argument. If the wavelength range of spct does not fully overlap with both wavebands NA is silently returned.

Methods (by class)

- normalized_diff_ind(default): default
- normalized_diff_ind(generic_spct):
- normalized_diff_ind(generic_mspct):

Note

Some NDxI indexes are directly based on satellite instrument data, such as those in the Landsat satellites. To simulate such indexes using spectral reflectande as input, constructors of waveband definitions from package 'photobiologyWavebands' can be useful.

normalize_range_arg 233

```
normalised_diff_ind() is a synonym for normalized_diff_ind(). NDxI() is a shorthand for normalized_diff_ind().
```

See Also

```
Rfr_normdiff
```

normalize_range_arg

Normalize a range argument into a true numeric range

Description

Several functions in this package and the suite accept a range argument with a flexible syntax. To ensure that all functions and methods behave in the same way this code has been factored out into a separate function.

Usage

```
normalize_range_arg(arg.range, wl.range, trim = TRUE)
```

Arguments

arg.range	a numeric vector of length two, or any other object for which function range() will return a range of wavelengths (nm).
wl.range	a numeric vector of length two, or any other object for which function range() will return a range of wavelengths (nm), missing values are not allowed.
trim	logical If TRUE the range returned is bound within wl.range while if FALSE it can be broader.

Details

The arg.range argument can contain NAs which are replaced by the value at the same position in wl.range. In addition a NULL argument for range is converted into wl.range. The wl.range is also the limit to which the returned value is trimmed if trim == TRUE. The idea is that the value supplied as wl.range is the wavelength range of the data.

Value

a numeric vector of length two, guaranteed not to have missing values.

```
normalize_range_arg(c(NA, 500), range(sun.spct))
normalize_range_arg(c(300, NA), range(sun.spct))
normalize_range_arg(c(100, 5000), range(sun.spct), FALSE)
normalize_range_arg(c(NA, NA), range(sun.spct))
normalize_range_arg(c(NA, NA), sun.spct)
```

oper_spectra

oper_spectra

Binary operation on two spectra, even if the wavelengths values differ

Description

The wavelength vectors of the two spectra are merged, and the missing spectral values are calculated by interpolation. After this, the two spectral values at each wavelength are added.

Usage

```
oper_spectra(
  w.length1,
  w.length2 = NULL,
  s.irrad1,
  s.irrad2,
  trim = "union",
  na.rm = FALSE,
  bin.oper = NULL,
  ...
)
```

Arguments

```
w.length1
                  numeric vector of wavelength (nm)
w.length2
                  numeric vector of wavelength (nm)
s.irrad1
                  a numeric vector of spectral values
s.irrad2
                  a numeric vector of spectral values
trim
                  a character string with value "union" or "intersection"
                  a logical value, if TRUE, not the default, NAs in the input are replaced with
na.rm
bin.oper
                  a function defining a binary operator (for the usual math operators enclose argu-
                  ment in backticks)
                  additional arguments (by name) passed to bin.oper
```

Details

If trim=="union" spectral values are calculated for the whole range of wavelengths covered by at least one of the input spectra, and missing values are set in each input spectrum to zero before addition. If trim=="intersection" then the range of wavelengths covered by both input spectra is returned, and the non-overlapping regions discarded. If w.length2==NULL, it is assumed that both spectra are measured at the same wavelengths, and a simple addition is used, ensuring fast calculation.

Value

a dataframe with two numeric variables

w.length A numeric vector with the wavelengths (nm) obtained by "fusing" w.length1 and w.length2. w.length contains all the unique vales, sorted in ascending order.s.irrad A numeric vector with the sum of the two spectral values at each wavelength.

See Also

Examples

```
head(sun.data)
result.data <-
    with(sun.data,
        oper_spectra(w.length, w.length, s.e.irrad, s.e.irrad, bin.oper=`+`))
head(result.data)
tail(result.data)
my_fun <- function(e1, e2, k) {return((e1 + e2) / k)}
result.data <-
    with(sun.data,
        oper_spectra(w.length, w.length, s.e.irrad, s.e.irrad, bin.oper=my_fun, k=2))
head(result.data)
tail(result.data)</pre>
```

peaks

Peaks or local maxima

Description

Function that returns a subset of an R object with observations corresponding to local maxima.

Usage

```
peaks(x, span, ignore_threshold, strict, na.rm, ...)
## Default S3 method:
peaks(x, span = NA, ignore_threshold = NA, strict = NA, na.rm = FALSE, ...)
## S3 method for class 'numeric'
peaks(x, span = 5, ignore_threshold = NA, strict = TRUE, na.rm = FALSE, ...)
```

peaks peaks

```

  span = 5,
  ignore_threshold = 0,
  strict = TRUE,
  na.rm = FALSE,
  var.name = "counts",
  refine.wl = FALSE,
 method = "spline",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

```
x an R object
```

span integer A peak is defined as an element in a sequence which is greater than all

other elements within a window of width span centered at that element. Use NULL for the global peak.

ignore_threshold

numeric Value between 0.0 and 1.0 indicating the relative size compared to tallest peak threshold below which peaks will be ignored. Negative values set a threshold so that the tallest peaks are ignored, instead of the shortest.

strict logical If TRUE, an element must be strictly greater than all other values in its

window to be considered a peak.

na.rm logical indicating whether NA values should be stripped before searching for

peaks.

... ignored

var.name, x.var.name, y.var.name

character Name of column where to look for peaks.

refine.wl logical Flag indicating if peak location should be refined by fitting a function.

method character String with the name of a method. Currently only spline interpolation

is implemented.

unit.out character One of "energy" or "photon"

filter.qty character One of "transmittance" or "absorbance"

. parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A subset of x with rows corresponding to local maxima.

Methods (by class)

- peaks(default): Default returning always NA.
- peaks(numeric): Default function usable on numeric vectors.
- peaks(data.frame): Method for "data.frame" objects.
- peaks(generic_spct): Method for "generic_spct" objects.
- peaks(source_spct): Method for "source_spct" objects.
- peaks(response_spct): Method for "response_spct" objects.
- peaks(filter_spct): Method for "filter_spct" objects.
- peaks(reflector_spct): Method for "reflector_spct" objects.
- peaks(solute_spct): Method for "solute_spct" objects.
- peaks(cps_spct): Method for "cps_spct" objects.
- peaks(raw_spct): Method for "raw_spct" objects.
- peaks(generic_mspct): Method for "generic_mspct" objects.

242 phenylalanine.spct

- peaks(source_mspct): Method for "source_mspct" objects.
- peaks(response_mspct): Method for "cps_mspct" objects.
- peaks(filter_mspct): Method for "filter_mspct" objects.
- peaks(reflector_mspct): Method for "reflector_mspct" objects.
- peaks(solute_mspct): Method for "solute_mspct" objects.
- peaks(cps_mspct): Method for "cps_mspct" objects.
- peaks(raw_mspct): Method for "raw_mspct" objects.

Note

Thresholds for ignoring peaks are applied after peaks are searched for, and negative threshold values can in some cases result in no peaks being returned.

peaks(sun.spct, span = 51, refine.wl = TRUE)
peaks(sun.spct)
```

phenylalanine.spct

Molar spectral attenuation coefficient of phenylalanine

Description

A dataset containing the wavelengths at a 0.25 nm interval and the corresponding attenuation coefficients.

Usage

```
phenylalanine.spct
```

Format

A solute_spct object with 1993 rows and 2 variables

Details

- w.length (nm), range 222 to 720 nm.
- K.mole (cm-1/M)

photodiode.spct 243

photodiode.spct

Spectral response of a GaAsP photodiode

Description

A dataset containing wavelengths at a 1 nm interval and spectral response as A/(W/nm) for GaAsP photodiode type G6262 from Hamamatsu. Data digitized from manufacturer's data sheet. The value at the peak is $0.19\ A/W$.

Usage

```
photodiode.spct
```

Format

A response_spct object with 94 rows and 2 variables

Details

- w.length (nm).
- s.e.response (A/W)

```
photodiode.spct
```

Description

This function gives the photons:energy ratio between for one given waveband of a radiation spectrum.

Usage

```
photons_energy_ratio(
   w.length,
   s.irrad,
   w.band = NULL,
   unit.in = "energy",
   check.spectrum = TRUE,
   use.cached.mult = FALSE,
   use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

Arguments

```
w.length numeric vector of wavelength (nm). s.irrad numeric vector of spectral irradiances in [W\ m^{-2}\ nm^{-1}] or [mol\ s^{-1}\ sm^{-2}\ nm^{-1}] as indicated by the argument pased to unit.in. waveband object. unit.in character Allowed values "energy", and "photon", or its alias "quantum". check.spectrum logical Flag telling whether to sanity check input data, default is TRUE. use.cached.mult
```

logical Flag telling whether multiplier values should be cached between calls.

photon_irradiance 245

use.hinges

logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.

Value

A single numeric value giving the ratio moles-photons per Joule.

Note

The default for the w.band parameter is a waveband covering the whole range of w.length.

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

Examples

```
# photons:energy ratio
with(sun.data, photons_energy_ratio(w.length, s.e.irrad, new_waveband(400,500)))
# photons:energy ratio for whole spectrum
with(sun.data, photons_energy_ratio(w.length, s.e.irrad))
```

photon_irradiance

Photon irradiance

Description

This function returns the photon irradiance for a given waveband of a radiation spectrum, optionally applies a BSWF.

Usage

```
photon_irradiance(
   w.length,
   s.irrad,
   w.band = NULL,
   unit.in = "energy",
   check.spectrum = TRUE,
   use.cached.mult = FALSE,
   use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

photon_ratio

Arguments

numeric vector of wavelength $[nm]$.	
numeric vector of spectral irradiances in [$Wm^{-2}nm^{-1}$] or [$mols^{-1}sm^{-2}nm^{-1}$] as indicated by the argument pased to unit.in.	
waveband.	
character Allowed values "energy", and "photon", or its alias "quantum".	
logical Flag telling whether to sanity check input data, default is TRUE.	
use.cached.mult	
logical Flag telling whether multiplier values should be cached between calls.	
logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.	

Value

A single numeric value with no change in scale factor: $[mol \, s^{-1} \, sm^{-2}]$.

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

Examples

```
with(sun.data, photon_irradiance(w.length, s.e.irrad))
with(sun.data, photon_irradiance(w.length, s.e.irrad, new_waveband(400,700)))
```

Photo:photon ratio
Photo:photon ratio

Description

This function gives the photon ratio between two given wavebands of a radiation spectrum.

photon_ratio 247

Usage

```
photon_ratio(
   w.length,
   s.irrad,
   w.band.num = NULL,
   w.band.denom = NULL,
   unit.in = "energy",
   check.spectrum = TRUE,
   use.cached.mult = FALSE,
   use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

Arguments

	w.length	numeric vector of wavelength (nm).
	s.irrad	numeric vector of spectral irradiances in [$Wm^{-2}nm^{-1}$] or [$mols^{-1}sm^{-2}nm^{-1}$] as indicated by the argument pased to unit.in.
	w.band.num	waveband object used to compute the numerator of the ratio.
	w.band.denom	waveband object used to compute the denominator of the ratio.
	unit.in	character Allowed values "energy", and "photon", or its alias "quantum".
	check.spectrum	logical Flag telling whether to sanity check input data, default is TRUE.
use.cached.mult		
		logical Flag telling whether multiplier values should be cached between calls.
	use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.

Value

a single numeric value giving the unitless ratio.

Note

The default for both w. band parameters is a waveband covering the whole range of w.length.

See Also

```
Other low-level functions operating on numeric vectors:: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

248 print.generic_spct

Examples

```
with(sun.data,
    photon_ratio(w.length, s.e.irrad, new_waveband(400,500), new_waveband(400,700)))
```

```
plus-.generic_spct
```

Arithmetic Operators

Description

Division operator for generic spectra.

Usage

```
## S3 method for class 'generic_spct'
e1 + e2 = NULL
```

Arguments

```
e1 an object of class "generic_spct"
e2 an object of class "generic_spct"
```

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), convolve_each(), div-.generic_spct, log(), minus-.generic_spct, mod-.generic_spct, round(), sign(), slash-.generic_spct, times-.generic_spct
```

```
print.generic_spct
```

Print spectral objects

Description

Print methods for objects of spectral classes, including collections of spectra.

Usage

```
## S3 method for class 'generic_spct'
print(x, ..., n = NULL, width = NULL)
## S3 method for class 'generic_mspct'
print(x, ..., n = NULL, width = NULL, n.members = 10)
```

print.generic_spct 249

Arguments

X	An object of one of the summary classes for spectra.
	not used in current version.
n	Number of rows to show. If NULL, the default, will print all rows if less than option dplyr.print_max. Otherwise, will print dplyr.print_min rows.
width	Width of text output to generate. This defaults to NULL, which means use getOption("width") and only display the columns that fit on one screen. You can also set option(dplyr.width = Inf) to override this default and always print all columns.

numeric Number of members of the collection to print.

Details

n.members

This is simply a wrapper on the print method for tibbles, with additional information in the header. Currently, width applies only to the table of data.

Objects are printed as is, ignoring the current settings of R options photobiology.radiation.unit and photobiology.filter.qty.

Value

Returns x invisibly.

Functions

• print(generic_mspct):

```
print(sun.spct)
print(sun.spct, n = 5)

print(q2e(sun.spct, action = "replace"))
print(e2q(sun.spct, action = "replace"))

print(polyester.spct)
print(any2A(polyester.spct))
print(any2Afr(polyester.spct))
print(two_filters.spct)
```

250 print.metadata

print.metadata

Print methods for metadata records

Description

Print methods for objects of classes used to store different meta data properties in the classes for different types of spectra.

Usage

```
## S3 method for class 'instr_desc'
print(x, ...)
## S3 method for class 'instr_settings'
print(x, ...)
## S3 method for class 'filter_properties'
print(x, ...)
## S3 method for class 'solute_properties'
print(x, ...)
```

Arguments

x An object of one of the summary classes for spectra.

... not used in current version.

Details

These methods print an abbreviated representation of objects used to store metadata in attributes. They are similar to *records* and formatted printing is useful both on its own and in the print methods for spectra and their summaries.

```
print(getInstrDesc(sun_evening.spct))
str(getInstrDesc(sun_evening.spct))
print(getInstrSettings(sun_evening.spct))
str(getInstrSettings(sun_evening.spct))
print(filter_properties(polyester.spct))
str(filter_properties(polyester.spct))
print(solute_properties(phenylalanine.spct))
str(solute_properties(phenylalanine.spct))
```

```
print.summary_generic_spct

Print spectral summary
```

Description

A function to nicely print objects of classes "summary...spct".

Usage

```
## S3 method for class 'summary_generic_spct'
print(x, ...)
## S3 method for class 'summary_generic_mspct'
print(x, width = NULL, ..., n = NULL)
```

Arguments

X	An object of one of the summary classes for spectra
	named arguments passed to the print() method for class "tbl_df".
width	integer Width of text output to generate. This defaults to NULL, which means use the width option.
n	integer Number of member spectra for which information is printed.

Functions

```
• print(summary_generic_mspct):
```

See Also

```
\quad \text{formatting} \quad
```

```
print(summary(sun.spct))
print(summary(sun_evening.mspct))
```

252 prod_spectra

print.waveband

Print a "waveband" object

Description

A function to more nicely print objects of class "waveband".

Usage

```
## S3 method for class 'waveband'
print(x, ...)
```

Arguments

x an object of class "waveband"
... not used in current version

prod_spectra

Multiply two spectra, even if the wavelengths values differ

Description

The wavelength vectors of the two spectra are merged, and the missing spectral values are calculated by interpolation. After this, the two spectral values at each wavelength are added.

Usage

```
prod_spectra(
   w.length1,
   w.length2 = NULL,
   s.irrad1,
   s.irrad2,
   trim = "union",
   na.rm = FALSE
)
```

Arguments

```
w.length1 numeric vector of wavelength (nm).
w.length2 numeric vector of wavelength (nm).
s.irrad1 a numeric vector of spectral values.
s.irrad2 a numeric vector of spectral values.
trim a character string with value "union" or "intersection".
na.rm a logical value, if TRUE, not the default, NAs in the input are replaced with
```

zeros.

pull_sample 253

Details

If trim=="union" spectral values are calculated for the whole range of wavelengths covered by at least one of the input spectra, and missing values are set in each input spectrum to zero before addition. If trim=="intersection" then the range of wavelengths covered by both input spectra is returned, and the non-overlapping regions discarded. If w.length2==NULL, it is assumed that both spectra are measured at the same wavelengths, and a simple addition is used, ensuring fast calculation.

Value

a dataframe with two numeric variables

w.length A numeric vector with the wavelengths (nm) obtained by "fusing" w.length1 and w.length2. w.length contains all the unique vales, sorted in ascending order.
 s.irrad A numeric vector with the sum of the two spectral values at each wavelength.

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

Examples

```
head(sun.data)
square.sun.data <-
  with(sun.data, prod_spectra(w.length, w.length, s.e.irrad, s.e.irrad))
head(square.sun.data)
tail(square.sun.data)</pre>
```

pull_sample

Random sample of spectra

Description

A method to extract a random sample of members from a list, a collection of spectra or a spectrum object containing multiple spectra in long form.

254 pull_sample

Usage

```
pull_sample(x, size, ...)
## Default S3 method:
pull_sample(x, size, ...)
## S3 method for class 'list'
pull_sample(
  х,
  size = 1,
  replace = FALSE,
  keep.order = TRUE,
  simplify = FALSE,
)
## S3 method for class 'generic_spct'
pull_sample(x, size = 1, replace = FALSE, keep.order = TRUE, ...)
## S3 method for class 'generic_mspct'
pull_sample(
 х,
  size = 1,
  replace = FALSE,
  recursive = FALSE,
  keep.order = TRUE,
  simplify = FALSE,
)
```

Arguments

X	An R object possibly containing multiple spectra or other components.
size	integer The number of spectra to extract, if available.
	currently ignored.
replace	logical Sample with or without replacement.
keep.order	logical Return the spectra ordered as in x or in random order.
simplify	logical If size = 1, and x is a collection return the spectrum object instead of a collection with it as only member.
recursive	logical If x is a collection, expand or not member spectra containing multiple

Value

If x is an spectrum object, such as a "filter_spct" object, the returned object is of the same class but in most cases containing fewer spectra in long form than x. If x is a collection of spectrum

spectra in long form into individual members before sampling.

255

objecta, such as a "filter_mspct" object, the returned object is of the same class but in most cases containing fewer member spectra than x.

Methods (by class)

- pull_sample(default): Default for generic function
- pull_sample(list): Specialization for generic_spct
- pull_sample(generic_spct): Specialization for generic_spct
- pull_sample(generic_mspct): Specialization for generic_mspct

See Also

See sample for the method used for the sampling.

Examples

```
a.list <- as.list(letters)
names(a.list) <- LETTERS
set.seed(12345678)
pull_sample(a.list, size = 8)
pull_sample(a.list, size = 8, keep.order = FALSE)
pull_sample(a.list, size = 8, replace = TRUE)
pull_sample(a.list, size = 8, replace = TRUE, keep.order = FALSE)
pull_sample(a.list, size = 1)
pull_sample(a.list, size = 1, simplify = TRUE)</pre>
```

q2e

Convert photon-based quantities into energy-based quantities

Description

Conversion methods for spectral photon irradiance into spectral energy irradiance and for spectral photon response into spectral energy response.

```
q2e(x, action, byref, ...)
## Default S3 method:
q2e(x, action = "add", byref = FALSE, ...)
## S3 method for class 'source_spct'
q2e(x, action = "add", byref = FALSE, ...)
## S3 method for class 'response_spct'
q2e(x, action = "add", byref = FALSE, ...)
```

256 q2e

```
## S3 method for class 'source_mspct'
q2e(x, action = "add", byref = FALSE, ..., .parallel = FALSE, .paropts = NULL)
## S3 method for class 'response_mspct'
q2e(x, action = "add", byref = FALSE, ..., .parallel = FALSE, .paropts = NULL)
```

Arguments

x an R object.

action a character string, one of "add", or "replace".

byref logical indicating if a new object will be created by reference or a new object

returned.

... not used in current version.

.parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

The converted spectral values are added to or replace the existing spectral values depending on the argument passed to parameter action. Addition is currently not supported for normalized spectra. If the spectrum has been normalized with a recent version of package 'photobiology' the spectrum will be renormalized after conversion using the same arguments as previously.

Methods (by class)

- q2e(default): Default method
- q2e(source_spct): Method for spectral irradiance
- q2e(response_spct): Method for spectral responsiveness
- q2e(source_mspct): Method for collections of (light) source spectra
- q2e(response_mspct): Method for collections of response spectra

qe_ratio 257

qe_ratio

Photon:energy ratio

Description

This function returns the photon to energy ratio for each waveband of a light source spectrum.

Usage

```
qe_ratio(spct, w.band, scale.factor, wb.trim, use.cached.mult, use.hinges, ...)
## Default S3 method:
qe_ratio(spct, w.band, scale.factor, wb.trim, use.cached.mult, use.hinges, ...)
## S3 method for class 'source_spct'
qe_ratio(
  spct,
 w.band = NULL
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  naming = "short",
  name.tag = ifelse(naming != "none", "[q:e]", ""),
)
## S3 method for class 'source_mspct'
qe_ratio(
  spct,
 w.band = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  naming = "short",
  name.tag = ifelse(naming != "none", "[q:e]", ""),
  . . . ,
  attr2tb = NULL,
  idx = "spct.idx"
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct source_spct.

258 qe_ratio

w. band waveband or list of waveband objects.

scale.factor numeric vector of length 1, or length equal to that of w.band. Numeric multiplier

applied to returned values.

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if

FALSE, they are discarded.

use.cached.mult

logical Flag telling whether multiplier values should be cached between calls.

use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

... other arguments (possibly used by derived methods).

naming character one of "long", "default", "short" or "none". Used to select the type of

names to assign to returned value.

name.tag character Used to tag the name of the returned values.

attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to

formal parameter col.names.

idx character Name of the column with the names of the members of the collection

of spectra.

. parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

The ratio is based on one photon irrandiance and one energy irradiance, both computed for the same waveband.

$$\frac{Q(s,wb)}{I(s,wb)}$$

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

Value

Computed values are ratios between photon irradiance and energy irradiance for a given waveband. A named numeric vector in the case of methods for individual spectra, with one value for each waveband passed to parameter w.band. A data.frame in the case of collections of spectra, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

q_fluence 259

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used, with "[q:e]" prepended. Units [mol J-1].

Methods (by class)

- qe_ratio(default): Default for generic function
- qe_ratio(source_spct): Method for source_spct objects
- qe_ratio(source_mspct): Calculates photon:energy ratio from a source_mspct object.

Performance

As this method accepts spectra as its input, it computes irradiances before computing the ratios. If you need to compute both ratios and irradiances from several hundreds or thousands of spectra, computing the ratios from previously computed irradiances avoids their repeated computation. A less dramatic, but still important, increase in performance is available when computing in the same function call ratios that share the same denominator.

Examples

q_fluence

Photon fluence

Description

Photon irradiance (i.e. quantum irradiance) for one or more waveband of a light source spectrum.

```
q_fluence(
   spct,
   w.band,
   exposure.time,
   scale.factor,
   wb.trim,
```

260 q_fluence

```
use.cached.mult,
  use.hinges,
  allow.scaled,
)
## Default S3 method:
q_fluence(
  spct,
 w.band,
  exposure.time,
  scale.factor,
 wb.trim,
  use.cached.mult,
  use.hinges,
  allow.scaled,
)
## S3 method for class 'source_spct'
q_fluence(
  spct,
 w.band = NULL,
  exposure.time,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
  allow.scaled = FALSE,
  naming = "default",
  . . .
)
## S3 method for class 'source_mspct'
q_fluence(
  spct,
  w.band = NULL,
  exposure.time,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
  allow.scaled = FALSE,
  naming = "default",
  attr2tb = NULL,
  idx = "spct.idx"
  .parallel = FALSE,
```

q_fluence 261

```
.paropts = NULL
)
```

Arguments

spct an R object.

w.band a list of waveband objects or a waveband object

exposure.time lubridate::duration object.

scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier

applied to returned values.

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if

FALSE, they are discarded.

use.cached.mult

logical indicating whether multiplier values should be cached between calls.

use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

allow.scaled logical indicating whether scaled or normalized spectra as argument to spet are

flagged as an error.

... other arguments (possibly ignored).

naming character one of "long", "default", "short" or "none". Used to select the type of

names to assign to returned value.

attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to

formal parameter col.names.

idx character Name of the column with the names of the members of the collection

of spectra.

. parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Value

One numeric value for each waveband with no change in scale factor, with name attribute set to the name of each waveband unless a named list is supplied in which case the names of the list elements are used. The exposure time is copied from the spectrum object to the output as an attribute. Units are as follows: moles of photons per exposure.

Methods (by class)

- q_fluence(default): Default for generic function
- q_fluence(source_spct): Calculate photon fluence from a source_spct object and the duration of the exposure
- q_fluence(source_mspct): Calculates photon (quantum) fluence from a source_mspct object.

262 q_fraction

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

Examples

q_fraction

Photon:photon fraction

Description

This function returns the photon fraction for a given pair of wavebands of a light source spectrum.

```
q_fraction(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
  wb.trim,
  use.cached.mult,
  use.hinges,
## Default S3 method:
q_fraction(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
  wb.trim,
  use.cached.mult,
```

q_fraction 263

```
use.hinges,
)
## S3 method for class 'source_spct'
q_fraction(
 spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "total",
  naming = "short",
  name.tag = NULL,
)
## S3 method for class 'source_mspct'
q_fraction(
  spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "total",
  naming = "short",
  name.tag = ifelse(naming != "none", "[q:q]", ""),
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct	an object of class "source_spct".
w.band.num	waveband object or a list of waveband objects used to compute the numerator(s) and $denominator(s)$ of the fraction(s).
w.band.denom	waveband object or a list of waveband objects used to compute the denominator(s) of the fraction(s).
scale.factor	numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values.

264 q_fraction

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if

FALSE, they are discarded

use.cached.mult

logical indicating whether multiplier values should be cached between calls

use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

other arguments (possibly ignored)

character One of "total", "average" or "mean". quantity

character one of "long", "default", "short" or "none". Used to select the type of naming

names to assign to returned value.

character Used to tag the name of the returned values. name.tag

character vector, see add_attr2tb for the syntax for attr2tb passed as is to attr2tb

formal parameter col.names.

idx character Name of the column with the names of the members of the collection

of spectra.

if TRUE, apply function in parallel, using parallel backend provided by foreach .parallel

.paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "total" the fraction is based on two photon irradiances, one computed for each waveband.

$$\frac{Q(s, wb_{\text{num}})}{Q(s, wb_{\text{denom}}) + Q(s, wb_{\text{num}})}$$

If the argument is set to quantity = "mean" or quantity = "average" the ratio is based on two mean spectral photon irradiances, one computed for each waveband.

$$\frac{\overline{Q_{\lambda}}(s, wb_{\text{num}})}{\overline{Q_{\lambda}}(s, wb_{\text{denom}}) + \overline{Q_{\lambda}}(s, wb_{\text{num}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[q:q]" is appended if quantity = "total" and "[q(wl):q(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

Methods (by class)

- q_fraction(default): Default for generic function
- q_fraction(source_spct): Method for source_spct objects
- q_fraction(source_mspct): Calculates photon:photon from a source_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

)
## Default S3 method:
q_irrad(
  spct,
 w.band,
  quantity,
  time.unit,
  scale.factor,
 wb.trim,
  use.cached.mult,
 use.hinges,
  allow.scaled,
## S3 method for class 'source_spct'
q_irrad(
  spct,
 w.band = NULL,
 quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
  allow.scaled = !quantity %in% c("average", "mean", "total"),
  naming = "default",
  return.tb = FALSE,
)
## S3 method for class 'source_mspct'
q_irrad(
 spct,
 w.band = NULL,
 quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = getOption("photobiology.use.cached.mult", default = FALSE),
  use.hinges = NULL,
  allow.scaled = !quantity %in% c("average", "mean", "total"),
```

```
naming = "default",
...,
attr2tb = NULL,
idx = "spct.idx",
.parallel = FALSE,
.paropts = NULL
)
```

Arguments

spct an R object. w.band a list of waveband objects or a waveband object. character string One of "total", "average" or "mean", "contribution", "contribuquantity tion.pc", "relative" or "relative.pc". time.unit character or lubridate::duration object. scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values. wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded. use.cached.mult logical indicating whether multiplier values should be cached between calls. logical Flag indicating whether to insert "hinges" into the spectral data before use.hinges integration so as to reduce interpolation errors at the boundaries of the wavebands. allow.scaled logical indicating whether scaled or normalized spectra as argument to spct are flagged as an error. other arguments (possibly ignored). character one of "long", "default", "short" or "none". Used to select the type of naming names to assign to returned value. logical Flag forcing a tibble to be always returned, even for a single spectrum as return.tb argumnet to spct. The default is FALSE for backwards compatibility. attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names. idx character Name of the column with the names of the members of the collection of spectra. if TRUE, apply function in parallel, using parallel backend provided by foreach .parallel .paropts a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Value

A named numeric vector in the case of a _spct object containing a single spectrum and return.tb = FALSE. The vector has one member one value for each waveband passed to parameter w. band. In all other cases a tibble, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used. The time unit attribute is copied from the spectrum object to the output. Units are as follows: If time unit is second, [W m-2 nm-1] -> [mol s-1 m-2] If time unit is day, [J d-1 m-2 nm-1] -> [mol d-1 m-2]

Methods (by class)

- q_irrad(default): Default for generic function
- q_irrad(source_spct): Calculates photon irradiance from a source_spct object.
- q_irrad(source_mspct): Calculates photon (quantum) irradiance from a source_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

q_ratio 269

q_ratio

Photon:photon ratio

Description

This function returns the photon ratio for a given pair of wavebands of a light source spectrum.

```
q_ratio(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
 wb.trim,
 use.cached.mult,
 use.hinges,
)
## Default S3 method:
q_ratio(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
 wb.trim,
 use.cached.mult,
 use.hinges,
)
## S3 method for class 'source_spct'
q_ratio(
  spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "total",
  naming = "short",
  name.tag = NULL,
)
```

270 q_ratio

```
## S3 method for class 'source_mspct'
q_ratio(
  spct.
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "total",
  naming = "short",
  name.tag = ifelse(naming != "none", "[q:q]", ""),
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct an object of class "source_spct". w.band.num waveband object or a list of waveband objects used to compute the numerator(s) of the ratio(s). w.band.denom waveband object or a list of waveband objects used to compute the denominator(s) of the ratio(s). scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values. wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded use.cached.mult logical indicating whether multiplier values should be cached between calls use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands. other arguments (possibly ignored) character One of "total", "average" or "mean". quantity character one of "long", "default", "short" or "none". Used to select the type of naming names to assign to returned value. character Used to tag the name of the returned values. name.tag attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names. idx character Name of the column with the names of the members of the collection of spectra. if TRUE, apply function in parallel, using parallel backend provided by foreach .parallel

q_ratio 271

.paropts

a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "total" the ratio is based on two photon irradiances, one computed for each waveband.

$$\frac{Q(s, wb_{\text{num}})}{Q(s, wb_{\text{denom}})}$$

If the argument is set to quantity = "mean" or quantity = "average" the ratio is based on two mean spectral photon irradiances, one computed for each waveband.

$$\frac{\overline{Q_{\lambda}}(s, wb_{\text{num}})}{\overline{Q_{\lambda}}(s, wb_{\text{denom}})}$$

Ratios based on totals and means are numerically identical only if the wavelength expanse of the two wavebands is the same.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[q:q]" is appended if quantity = "total" and "[q(wl):q(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Methods (by class)

- q_ratio(default): Default for generic function
- q_ratio(source_spct): Method for source_spct objects
- q_ratio(source_mspct): Calculates photon:photon from a source_mspct object.

272 q_response

Performance

As this method accepts spectra as its input, it computes irradiances before computing the ratios. If you need to compute both ratios and irradiances from several hundreds or thousands of spectra, computing the ratios from previously computed irradiances avoids their repeated computation. A less dramatic, but still important, increase in performance is available when computing in the same function call ratios that share the same denominator.

```

Examples

q_response

Photon-based photo-response

Description

This function returns the mean response for a given waveband and a response spectrum.

```
q_response(
  spct,
  w.band,
  quantity,
  time.unit,
  scale.factor,
 wb.trim,
  use.hinges,
## Default S3 method:
q_response(
  spct,
 w.band,
  quantity,
  time.unit,
  scale.factor,
  wb.trim,
```

q_response 273

```
use.hinges,
)
## S3 method for class 'response_spct'
q_response(
  spct,
 w.band = NULL,
  quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = getOption("photobiology.use.hinges", default = NULL),
  naming = "default",
)
## S3 method for class 'response_mspct'
q_response(
  spct,
 w.band = NULL,
  quantity = "total",
  time.unit = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = getOption("photobiology.use.hinges", default = NULL),
  naming = "default",
  ...,
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct	an R object.
w.band	waveband or list of waveband objects or a numeric vector of length two. The waveband(s) determine the region(s) of the spectrum that are summarized. If a numeric range is supplied a waveband object is constructed on the fly from it.
quantity	character string One of "total", "average" or "mean", "contribution", "contribution.pc", "relative" or "relative.pc".
time.unit	character or lubridate::duration object.
scale.factor	numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values.
wb.trim	logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded.

274 q_response

use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
	other arguments (possibly used by derived methods).
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
attr2tb	character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A named numeric vector in the case of methods for individual spectra, with one value for each waveband passed to parameter w.band. A data.frame in the case of collections of spectra, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used.

Methods (by class)

- q_response(default): Default method for generic function
- q_response(response_spct): Method for response spectra.
- q_response(response_mspct): Calculates photon (quantum) response from a response_mspct

Note

The parameter use.hinges controls speed optimization. The defaults should be suitable in most cases. Only the range of wavelengths in the wavebands is used and all BSWFs are ignored.

r4p_pkgs 275

r4p_pkgs

Packages in R for Photobiology suite

Description

A dataset containing the names of all the packages in this suite.

Usage

```
r4p_pkgs
```

Format

A character vector.

Details

A character vector.

Examples

```
r4p_pkgs
```

rbindspct

Row-bind spectra

Description

A wrapper on $dplyr::rbind_fill$ that preserves class and other attributes of spectral objects.

```
rbindspct(
    l,
    use.names = TRUE,
    fill = TRUE,
    idfactor = TRUE,
    attrs.source = NULL,
    attrs.simplify = FALSE
)
```

276 rbindspct

Arguments

1 A source_mspct, filter_mspct, reflector_mspct, response_mspct, chroma_mspct, cps_mspct, generic_mspct object or a list containing source_spct, filter_spct, reflector_spct, response_spct, chroma_spct, cps_spct, or generic_spct objects. logical If TRUE items will be bound by matching column names. By default use.names TRUE for rbindspct. Columns with duplicate names are bound in the order of occurrence, similar to base. When TRUE, at least one item of the input list has to have non-null column names. fill logical If TRUE fills missing columns with NAs. By default TRUE. When TRUE, use.names has also to be TRUE, and all items of the input list have to have nonnull column names. idfactor logical or character Generates an index column of factor type. Default is (idfactor=TRUE) for both lists and _mspct objects. If idfactor=TRUE then the column is auto named spct.idx. Alternatively the column name can be directly provided to idfactor as a character string. attrs.source integer Index into the members of the list from which attributes should be copied. If NULL, all attributes are collected into named lists, except that unique comments are pasted. attrs.simplify logical Flag indicating that when all values of an attribute are equal for all members, the named list will be replaced by a single copy of the value.

Details

Each item of 1 should be a spectrum, including NULL (skipped) or an empty object (0 rows). rbindspc is most useful when there are a variable number of (potentially many) objects to stack. rbindspct always returns at least a generic_spct as long as all elements in 1 are spectra.

Value

An spectral object of a type common to all bound items containing a concatenation of all the items passed in. If the argument 'idfactor' is TRUE, then a factor 'spect.idx' will be added to the returned spectral object.

Note

Note that any additional 'user added' attributes that might exist on individual items of the input list will not be preserved in the result. The attributes used by the photobiology package are preserved, and if they are not consistent across the bound spectral objects, a warning is issued.

dplyr::rbind_fill is called internally and the result returned is the highest class in the inheritance hierarchy which is common to all elements in the list. If not all members of the list belong to one of the _spct classes, an error is triggered. The function sets all data in source_spct and response_spct objects supplied as arguments into energy-based quantities, and all data in filter_spct objects into transmittance before the row binding is done. If any member spectrum is tagged, it is untagged before row binding.

reflectance 277

Examples

```
# default, adds factor 'spct.idx' with letters as levels
spct <- rbindspct(list(sun.spct, sun.spct))</pre>
spct
class(spct)
# adds factor 'spct.idx' with letters as levels
spct <- rbindspct(list(sun.spct, sun.spct), idfactor = TRUE)</pre>
head(spct)
class(spct)
# adds factor 'spct.idx' with the names given to the spectra in the list
# supplied as formal argument 'l' as levels
spct <- rbindspct(list(one = sun.spct, two = sun.spct), idfactor = TRUE)</pre>
head(spct)
class(spct)
# adds factor 'ID' with the names given to the spectra in the list
# supplied as formal argument 'l' as levels
spct <- rbindspct(list(one = sun.spct, two = sun.spct),</pre>
                  idfactor = "ID")
head(spct)
class(spct)
```

reflectance

Reflectance

Description

Function to calculate the mean, total, or other summary of reflectance for spectral data stored in a reflector_spct or in an object_spct.

```
reflectance(spct, w.band, quantity, wb.trim, use.hinges, ...)
## Default S3 method:

    wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
    use.hinges = NULL,
    naming = "default",
```

278 reflectance

```
)
## S3 method for class 'object_spct'
reflectance(
  spct,
 w.band = NULL,
  quantity = "average",
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
)
## S3 method for class 'reflector_mspct'
reflectance(
  spct,
 w.band = NULL,
  quantity = "average",
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'object_mspct'
reflectance(
  spct,
 w.band = NULL,
  quantity = "average",
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
  . . . ,
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

```
spct an R object
w.band waveband or list of waveband objects or a numeric vector of length two. The
```

reflectance 279

	waveband(s) determine the region(s) of the spectrum that are summarized. If a numeric range is supplied a waveband object is constructed on the fly from it.
quantity	character string One of "average" or "mean", "total", "contribution", "contribution.pc", "relative" or "relative.pc".
wb.trim	logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded.
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
	other arguments
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
attr2tb	character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A named numeric vector in the case of methods for individual spectra, with one value for each waveband passed to parameter w.band. A data.frame in the case of collections of spectra, containing one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used.

Methods (by class)

- reflectance(default): Default for generic function
- reflectance(reflector_spct): Specialization for reflector_spct
- reflectance(object_spct): Specialization for object_spct
- reflectance(reflector_mspct): Calculates reflectance from a reflector_mspct
- reflectance(object_mspct): Calculates reflectance from a object_mspct

Note

The use.hinges parameter controls speed optimization. The defaults should be suitable in most cases. Only the range of wavelengths in the wavebands is used and all BSWFs are ignored.

280 replace_bad_pixs

Examples

```
reflectance(black_body.spct, waveband(c(400,700)))
reflectance(white_body.spct, waveband(c(400,700)))
```

replace_bad_pixs

Replace bad pixels in a spectrum

Description

This function replaces data for bad pixels by a local estimate, by either simple interpolation or using the algorithm of Whitaker and Hayes (2018).

Usage

```
replace_bad_pixs(
   x,
   bad.pix.idx = FALSE,
   window.width = 11,
   method = "run.mean",
   na.rm = TRUE
)
```

Arguments

x numeric vector containing spectral data.

bad.pix.idx logical vector or integer. Index into bad pixels in x.

window.width integer. The full width of the window used for the running mean.

method character The name of the method: "run.mean" is running mean as described

in Whitaker and Hayes (2018); "adj.mean" is mean of adjacent neighbors (iso-

lated bad pixels only).

na.rm logical Treat NA values as additional bad pixels and replace them.

Details

Simple interpolation replaces values of isolated bad pixels by the mean of their two closest neighbors. The running mean approach allows the replacement of short runs of bad pixels by the running mean of neighboring pixels within a window of user-specified width. The first approach works well for spectra from array spectrometers to correct for hot and dead pixels in an instrument. The second approach is most suitable for Raman spectra in which spikes triggered by radiation are wider than a single pixel but usually not more than five pixels wide.

Value

A logical vector of the same length as x. Values that are TRUE correspond to local spikes in the data.

response 281

Note

In the current implementation NA values are not removed, and if they are in the neighborhood of bad pixels, they will result in the generation of additional NAs during their replacement.

Rfr_fraction

reflectance:reflectance fraction

Description

This function returns the reflectance fraction for a given pair of wavebands of a reflector spectrum.

```
Rfr_fraction(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
  wb.trim,
  use.cached.mult,
  use.hinges,
)
## Default S3 method:
Rfr_fraction(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
 wb.trim,
  use.cached.mult,
  use.hinges,
  . . .
)
## S3 method for class 'reflector_spct'
Rfr_fraction(
  spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
```

Rfr_fraction 285

```
use.cached.mult = FALSE,
 use.hinges = NULL,
 quantity = "mean",
 naming = "short",
 name.tag = NULL,
)
## S3 method for class 'reflector_mspct'
Rfr_fraction(
 spct,
 w.band.num = NULL,
 w.band.denom = NULL,
 scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
 use.cached.mult = FALSE,
 use.hinges = NULL,
 quantity = "mean",
 naming = "short",
 name.tag = NULL,
 attr2tb = NULL,
 idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct	an object of class "reflector_spct".
w.band.num	waveband object or a list of waveband objects used to compute the numerator(s) and denominator(s) of the fraction(s).
w.band.denom	waveband object or a list of waveband objects used to compute the denominator(s) of the fraction(s).
scale.factor	numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values.
wb.trim	logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded
use.cached.mult	
	logical indicating whether multiplier values should be cached between calls
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
	other arguments (possibly ignored)
quantity	character One of "total", "average" or "mean".
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.

name.tag	character Used to tag the name of the returned values.
attr2tb	character vector, see $add_attr2tb$ for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "mean" or quantity = "average" the ratio is based on two **mean spectral reflectance**, one computed for each waveband.

$$\frac{\overline{\operatorname{Rfr}_{\lambda}}(s,wb_{\operatorname{num}})}{\overline{\operatorname{Rfr}_{\lambda}}(s,wb_{\operatorname{denom}}) + \overline{\operatorname{Rfr}_{\lambda}}(s,wb_{\operatorname{num}})}$$

If the argument is set to quantity = "total" the fraction is based on two **integrated reflectance**, one computed for each waveband.

$$\frac{\operatorname{Rfr}(s, wb_{\operatorname{num}})}{\operatorname{Rfr}(s, wb_{\operatorname{denom}}) + \operatorname{Rfr}(s, wb_{\operatorname{num}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[Rfr:Rfr]" is appended if quantity = "total" and "[Rfr(wl):Rfr(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

Methods (by class)

- Rfr_fraction(default): Default for generic function
- Rfr_fraction(reflector_spct): Method for reflector_spct objects
- Rfr_fraction(reflector_mspct): Calculates Rfr:Rfr from a reflector_mspct object.

Rfr_from_n 287

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

See Also

Other Reflectance ratio functions: Rfr_normdiff(), Rfr_ratio()

Examples

Rfr_from_n

Reflectance at a planar boundary

Description

The reflectance at the planar boundary between two media, or interface, can be computed from the relative refractive index. Reflectance depends on polarization, and the process of reflection can generate polarized light through selective reflection of s and p components. A perfectly flat (i.e., polished) interface creates specular reflection, and this is the case that these functions describe. These function describe a single interface, and for example in a glass pane, a light beam will cross two air-glass interfaces.

```
Rfr_from_n(angle_deg, angle = angle_deg/180 * pi, n = 1.5, p_fraction = 0.5)
Rfr_p_from_n(angle_deg, angle = angle_deg/180 * pi, n = 1.5)
Rfr_s_from_n(angle_deg, angle = angle_deg/180 * pi, n = 1.5)
```

288 Rfr_normdiff

Arguments

angle_deg, angle

numeric vector Angle of incidence of the light beam, in degrees or radians. If

both are supplied, radians take precedence.

n numeric vector, or generic_spct object Relative refractive index. The default 1.5

is suitable for crown glass or acrylic interacting with visible light. n depends on

wavelength, more or less strongly depending on the material.

p_fraction numeric in range 0 to 1. Polarization, defaults to 0.5 assuming light that is not

polarized.

Details

These functions implement Fresnel's formulae. All parameters accept vectors as arguments. If both n and angle are vectors with length different from one, they should both have the same length. Reflectance depends on polarization, the s and p components need to be computed separately and added up. $Rfr_from_n()$ is for non-polarized light, i.e., with equal contribution of the two components.

Value

If n is a numeric vector the returned value is a vector of reflectances, while if n is a generic_spct object the returned value is a reflector_spct object.

Examples

```
Rfr_from_n(0:90)

Rfr_from_n(0:90, p_fraction = 1)

Rfr_from_n(0:90, n = 1.333) # water
```

Rfr_normdiff

reflectance:reflectance normalised difference

Description

This function returns the reflectance normalized difference index for a given pair of wavebands of a reflector spectrum.

```
Rfr_normdiff(
   spct,
   w.band.plus,
   w.band.minus,
   scale.factor,
   wb.trim,
   use.cached.mult,
```

Rfr_normdiff 289

```
use.hinges,
)
## Default S3 method:
Rfr_normdiff(
  spct,
 w.band.plus,
 w.band.minus,
  scale.factor,
 wb.trim,
  use.cached.mult,
  use.hinges,
)
## S3 method for class 'reflector_spct'
Rfr_normdiff(
  spct,
 w.band.plus = NULL,
 w.band.minus = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "mean",
  naming = "short",
 name.tag = NULL,
)
## S3 method for class 'reflector_mspct'
Rfr_normdiff(
  spct,
 w.band.plus = NULL,
 w.band.minus = NULL,
  scale.factor = 1,
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "mean",

  name.tag = NULL,
  attr2tb = NULL,
  idx = "spct.idx"
  .parallel = FALSE,
  .paropts = NULL
```

290 Rfr_normdiff

)

Arguments

spct an object of class "reflector_spct".

w.band.plus, w.band.minus

waveband object(s) or a list(s) of waveband objects used to compute the additive

and subtractive reflectance terms of the normalized difference index.

scale.factor numeric vector of length 1, or length equal to that of w.band. Numeric multiplier

applied to returned values.

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if

FALSE, they are discarded

use.cached.mult

logical indicating whether multiplier values should be cached between calls

use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

... other arguments (possibly ignored)

quantity character One of "total", "average" or "mean".

naming character one of "long", "default", "short" or "none". Used to select the type of

names to assign to returned value.

name.tag character Used to tag the name of the returned values.

attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to

formal parameter col.names.

idx character Name of the column with the names of the members of the collection

of spectra.

. parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "mean" or quantity = "average" the ratio is based on two **mean spectral photon reflectances**, one computed for each waveband.

$$\frac{\overline{\operatorname{Rfr}_{\lambda}}(s, wb_{\operatorname{plus}}) - \overline{\operatorname{Rfr}_{\lambda}}(s, wb_{\operatorname{minus}})}{\overline{\operatorname{Rfr}_{\lambda}}(s, wb_{\operatorname{plus}}) + \overline{\operatorname{Rfr}_{\lambda}}(s, wb_{\operatorname{minus}})}$$

If the argument is set to quantity = "total" the fraction is based on two **photon reflectances**, one computed for each waveband.

$$\frac{\operatorname{Rfr}(s, wb_{\operatorname{plus}}) - \operatorname{Rfr}(s, wb_{\operatorname{minus}})}{\operatorname{Rfr}(s, wb_{\operatorname{plus}}) + \operatorname{Rfr}(s, wb_{\operatorname{minus}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Rfr_normdiff 291

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[Rfr:Rfr]" is appended if quantity = "total" and "[Rfr(wl):Rfr(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

Methods (by class)

- Rfr_normdiff(default): Default for generic function
- Rfr_normdiff(reflector_spct): Method for reflector_spct objects
- Rfr_normdiff(reflector_mspct): Calculates Rfr:Rfr from a reflector_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult =T RUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

 use.cached.mult,
 use.hinges,
)
## S3 method for class 'reflector_spct'
Rfr_ratio(
  spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "mean",
  naming = "short",
  name.tag = NULL,
)
```

Rfr_ratio 293

```
## S3 method for class 'reflector_mspct'
Rfr_ratio(
  spct.
  w.band.num = NULL,
  w.band.denom = NULL,
  scale.factor = 1,
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "mean",
  naming = "short",
  name.tag = NULL,
  attr2tb = NULL,
  idx = "spct.idx",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct an object of class "reflector_spct". w.band.num waveband object or a list of waveband objects used to compute the numerator(s) and denominator(s) of the ratio(s). w.band.denom waveband object or a list of waveband objects used to compute the denominator(s) of the ratio(s). scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier applied to returned values. wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded use.cached.mult logical indicating whether multiplier values should be cached between calls use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands. other arguments (possibly ignored) quantity character One of "total", "average" or "mean". character one of "long", "default", "short" or "none". Used to select the type of naming names to assign to returned value. character Used to tag the name of the returned values. name.tag character vector, see add_attr2tb for the syntax for attr2tb passed as is to attr2tb formal parameter col.names. idx character Name of the column with the names of the members of the collection of spectra. .parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

.paropts

a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "mean" or quantity = "average" the ratio is based on two **mean spectral reflectance**, one computed for each waveband.

$$\frac{\overline{\mathrm{Rfr}_{\lambda}}(s, wb_{\mathrm{num}})}{\overline{\mathrm{Rfr}_{\lambda}}(s, wb_{\mathrm{denom}}))}$$

If the argument is set to quantity = "total" the ratio is based on two **integrated reflectance**, one computed for each waveband.

$$\frac{\operatorname{Rfr}(s, wb_{\text{num}})}{\operatorname{Rfr}(s, wb_{\text{denom}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[Rfr:Rfr]" is appended if quantity = "total" and "[Rfr(wl):Rfr(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

Methods (by class)

- Rfr_ratio(default): Default for generic function
- Rfr_ratio(reflector_spct): Method for reflector_spct objects
- Rfr_ratio(reflector_mspct): Calculates Rfr:Rfr from a reflector_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

rgb_spct 295

See Also

Other Reflectance ratio functions: Rfr_fraction(), Rfr_normdiff()

Examples

rgb_spct

RGB color values

Description

This function returns the RGB values for a source spectrum.

Usage

```
rgb_spct(spct, sens = photobiology::ciexyzCMF2.spct, color.name = NULL)
```

Arguments

spct an object of class "source_spct"

sens a chroma_spct object with variables w.length, x, y, and z, giving the CC or CMF

definition (default is the proposed human CMF according to CIE 2006.)

color . name character string for naming the rgb color definition

Value

A color defined using rgb(). The numeric values of the RGB components can be obtained

See Also

```
Other color functions: w_length2rgb(), w_length_range2rgb()
```

Examples

```
rgb_spct(sun.spct)
```

296 rmDerivedSpct

rmDerivedMspct

Remove "generic_mspct" and derived class attributes.

Description

Removes from a spectrum object the class attributes "generic_mspct" and any derived class attribute such as "source_mspct". **This operation is done by reference!**

Usage

```
rmDerivedMspct(x)
```

Arguments

Х

an R object.

Value

A character vector containing the removed class attribute values. This is different to the behaviour of function unlist in base R!

Note

If x is an object of any of the multi spectral classes defined in this package, this function changes by reference the multi spectrum object into the underlying list object. Otherwise, it just leaves x unchanged. The modified x is also returned invisibly.

See Also

Other set and unset 'multi spectral' class functions: shared_member_class()

rmDerivedSpct

Remove "generic_spct" and derived class attributes.

Description

Removes from a spectrum object the class attributes "generic_spct" and any derived class attribute such as "source_spct". **This operation is done by reference!**

```
rmDerivedSpct(x, keep.classes = NULL)
```

round 297

Arguments

```
x an R object.

keep.classes character vector Names of classes to keep. Can be used to retain base class "generic_spct".
```

Details

This function alters x itself by reference. If x is not a generic_spct object, x is not modified. This function behaves similarly to setdiff() but preserving the original order of the character vector of the S3 class names.

Value

A character vector containing the removed class attribute values. This is different to the behaviour of function unlist in base R!

Note

If x is an object of any of the spectral classes defined in this package, this function changes by reference the spectrum object into the underlying data.frame object. Otherwise, it just leaves x unchanged.

See Also

Other set and unset spectral class functions: setGenericSpct()

Examples

```
my.spct <- sun.spct
removed <- rmDerivedSpct(my.spct)
removed
class(sun.spct)
class(my.spct)</pre>
```

round

Rounding of Numbers

Description

ceiling takes a single numeric argument x and returns a numeric vector containing the smallest integers not less than the corresponding elements of x. \ floor takes a single numeric argument x and returns a numeric vector containing the largest integers not greater than the corresponding elements of x. \ trunc takes a single numeric argument x and returns a numeric vector containing the integers formed by truncating the values in x toward 0. \ round rounds the values in its first argument to the specified number of decimal places (default 0). \ signif rounds the values in its first argument to the specified number of significant digits. \ The functions are applied to the spectral data, not the wavelengths. The quantity in the spectrum to which the function is applied depends on the class of x and the current value of output options.

298 select_spct_attributes

Usage

```
## S3 method for class 'generic_spct'
round(x, digits = 0)

## S3 method for class 'generic_spct'
signif(x, digits = 6)

## S3 method for class 'generic_spct'
ceiling(x)

## S3 method for class 'generic_spct'
floor(x)

## S3 method for class 'generic_spct'
trunc(x, ...)
```

Arguments

```
    an object of class "generic_spct" or a derived class.
    digits integer indicating the number of decimal places (round) or significant digits (signif) to be used. Negative values are allowed (see 'Details').
    arguments to be passed to methods.
```

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), convolve_each(), div-.generic_spct, log(), minus-.generic_spct, mod-.generic_spct, plus-.generic_spct, sign(), slash-.generic_spct, times-.generic_spct
```

```
select_spct_attributes
```

Merge user supplied attribute names with default ones

Description

Allow users to add and subtract from default attributes in addition to providing a given set of attributes.

```
select_spct_attributes(attributes, attributes.default = spct_attributes())
spct_attributes(.class = "all", attributes = "*")
```

setBSWFUsed 299

Arguments

```
attributes, attributes.default
character vector or a list of character vectors.
.class character Name of spectral class.
```

Details

Vectors of character strings passed as argument to attributes are parsed so that if the first member string is "+", the remaining members are added to those in attributes.default; if it is "-" the remaining members are removed from in attributes.default; and if it is "=" the remaining members replace those in in attributes.default. If the first member is none of these three strings, the behaviour is the same as when the first string is "=". If attributes is NULL all the attributes in attributes.default are used and if it is "" no attribute names are returned, "" has precedence over other member values. The order of the names of annotations has no meaning: the vector is interpreted as a set except for the three possible "operators" at position 1.

Value

A character vector of attribute names.

See Also

```
get_attributes
```

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrDesc(), trimInstrSettings()
```

setBSWFUsed

The "bswf.used" attribute

Description

Function to set by reference the "time.unit" attribute of an existing source_spct object, and function to query its value.

Usage

```
setBSWFUsed(x, bswf.used = c("none", "unknown"))
getBSWFUsed(x)
```

Arguments

```
a source_spct object.
```

bswf.used a character string, either "none" or the name of a BSWF.

300 setFilterProperties

Details

Effective spectral irradiance, describes an estimate of the strength of the radiation towards eliciting a given response, frequently, but not only a biological response. The biological spectral weighting function, BSWF, used, can be for example that of the human eye, or an action spectrum, such as the erythema, or reddening of the human skin, action spectrum.

$$I_{BE}(\lambda) = I(\lambda) \times f_{BE}(\lambda)$$

where, $I_{BE}(\lambda)$ is the biologically effective spectral irradiance, $I(\lambda)$ is the spectral irradiance and $f_{BE}(\lambda)$ is one of many possible BSWF.

When the values stored in a source_spct object have been multiplied by those from a curve describing a certain response or effect, the attribute "time.unit" is set accordingly to track the transformation applied to the data. When a spectral response data have been directly measured, they should be stored in an object of class response_spct as they are expressed in actual response units, not of class source_spct expressed in irradiance units, even if weighted. However, when like in the case of spectral illuminance, the aim is technical measure of a light source, class source_spct should be used and the BSWF set in the metadata.

This attribute is normally set by the function or operator used to apply the BSWF to spectral irradiance data, or set when the source_spct object is created.

Value

x or the character value stored in x.

Note

Function setBSWFUsed() alters x itself by reference and in addition returns x invisibly. If x is not a source_spct, x is not modified. The behaviour of this function is 'unusual' in that the default for parameter bswf.used is used only if x does not already have this attribute set. Function getBSWFUsed() returns the value to which the attribute is set as a character string and otherwise NA.

Examples

getBSWFUsed(sun.spct)

setFilterProperties

Set the "filter.properties" attribute

Description

Function to set by reference the "filter.properties" attribute of an existing filter_spct object.

setFilterProperties 301

Usage

```
setFilterProperties(
    x,
    filter.properties = NULL,
    pass.null = FALSE,
    Rfr.constant = NA_real_,
    thickness = NA_real_,
    attenuation.mode = NA_character_
)
filter_properties(x) <- value</pre>
```

Arguments

```
x a filter_spct object filter.properties, value a list with fields named "Rfr.constant", "thickness" and "attenuation.mode". pass.null logical If TRUE, the parameters to the next three parameters will be always ignored, otherwise they will be used to build an object of class "filter.properties" when the argument passed to parameter filter.properties is NULL. Rfr.constant numeric The value of the reflection factor [/1]. thickness numeric The thickness of the material [m]. attenuation.mode character One of "reflection", "absorption", "absorption.layer", "scattering", "mixed" or "stack".
```

Details

Storing filter properties allows inter-conversion between internal and total transmittance, as well as computation of transmittance for arbitrary thickness of the material. Whether computations are valid depend on the homogeneity of the material. The parameter pass.null makes it possible to remove the attribute.

Value

Х

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a filter_spct object, x is not modified.

The values of attenuation.mode "reflection", "absorption", "absorption.layer" or "scattering" should be used when one of these processes is clearly the main one; "mixed" is for when multiple modes play a significant role, i.e., when a simple correction using a single value of Rfr across wavelengths is not possible; "absorption.layer" is for cases when a thin absorbing layer is deposited on the surface of a transparent support or enclosed between two sheets of glass or other transparent material. Finally "stack" is for multiple individual filters piled. If in doubt, set this argument to NA to ensure that computation of spectra for a different thickness remains disabled.

```

Examples

setGenericSpct

Convert an R object into a spectrum object.

Description

Sets the class attribute of a data.frame or an object of a derived class to "generic_spct".

```
setGenericSpct(x, multiple.wl = 1L, idfactor = NULL)

setCalibrationSpct(
    x,
    strict.range = getOption("photobiology.strict.range", default = FALSE),
    multiple.wl = 1L,
    idfactor = NULL
)

setRawSpct(
    x,
    strict.range = getOption("photobiology.strict.range", default = FALSE),
    multiple.wl = 1L,
    idfactor = NULL
)

setCpsSpct(
```

```
Χ,
  time.unit = "second",
  strict.range = getOption("photobiology.strict.range", default = FALSE),
 multiple.wl = 1L,
 idfactor = NULL
)
setFilterSpct(
  х,
 Tfr.type = c("total", "internal"),
 Rfr.constant = NA_real_,
  thickness = NA_real_,
  attenuation.mode = NA_character_,
  strict.range = getOption("photobiology.strict.range", default = FALSE),
 multiple.wl = 1L,
  idfactor = NULL
)
setSoluteSpct(
 K.type = c("attenuation", "absorption", "scattering"),
 name = NA_character_,
 mass = NA_character_,
  formula = NA_character_,
  structure = grDevices::as.raster(matrix()),
  ID = NA_character_,
  solvent.name = NA_character_,
  solvent.ID = NA_character_,
  strict.range = getOption("photobiology.strict.range", default = FALSE),
 multiple.wl = 1L,
  idfactor = NULL
)
setReflectorSpct(
 Х,
 Rfr.type = c("total", "specular"),
 strict.range = getOption("photobiology.strict.range", default = FALSE),
 multiple.wl = 1L,
  idfactor = NULL
)
setObjectSpct(
 Tfr.type = c("total", "internal"),
 Rfr.type = c("total", "specular"),
  strict.range = getOption("photobiology.strict.range", default = FALSE),
 multiple.wl = 1L,
  idfactor = NULL
```

```
setResponseSpct(
    x,
    time.unit = "second",
    response.type = "response",
    multiple.wl = 1L,
    idfactor = NULL
)

setSourceSpct(
    x,
    time.unit = "second",
    bswf.used = c("none", "unknown"),
    strict.range = getOption("photobiology.strict.range", default = FALSE),
    multiple.wl = 1L,
    idfactor = NULL
)

setChromaSpct(x, multiple.wl = 1L, idfactor = NULL)
```

Arguments

formula

structure

data.frame, list or generic_spct and derived classes Χ multiple.wl numeric Maximum number of repeated w. length entries with same value. idfactor character Name of factor distinguishing multiple spectra when stored longitudinally (required if mulitple.wl > 1). logical Flag indicating whether off-range values result in an error instead of a strict.range warning. character string indicating the time unit used for spectral irradiance or exposure time.unit ("second", "day" or "exposure") or an object of class duration as defined in package lubridate. character Either "total" or "internal". Tfr.type Rfr.constant numeric The value of the reflection factor [/1]. numeric The thickness of the material. thickness attenuation.mode character One of "reflection", "absorption" or "mixed". character A string, either "attenuation", "absorption" or "scattering". K. type name, solvent.name character The names of the substance and of the solvent. A named character vector, with member names such as "IUPAC" for the authority. numeric The mass in Dalton (Da = g/mol). mass

character The molecular formula.

raster A bitmap of the structure.

ID, solvent. ID character The IDs of the substance and of the solvent. A named character vector,

with member names such as "ChemSpider" or "PubChen" for the authority.

Rfr. type character A string, either "total" or "specular".

response.type a character string, either "response" or "action".

bswf.used character A string, either "none" or the name of a BSWF. (Users seldom need

to change the default, as this metadata value is in normal use set by operators or

functions that apply a BSWF.)

Details

This method alters x itself by reference and in addition returns the modified x invisibly. The wavelength values and data are checked for validity and out-of-range values trigger warnings. These checks are done during construction by means of the matching check_spct methods, unless checks have been disabled by setting the corresponding option (see enable_check_spct).

Value

X

Functions

- setCalibrationSpct(): Set class of a an object to "calibration_spct".

- setSourceSpct(): Set class of an object to "source_spct".
- setChromaSpct(): Set class of an object to "chroma_spct".

Warning!

Not entering metadata when creating an object will limit the available operations!

Note

"internal" **transmittance** is defined as the transmittance of the material body itself, while "total" transmittance includes the effects of surface reflectance on the amount of light transmitted. For non-diffusing materials like glass an approximate Rfr.constant value can be used to inter-convert total and internal transmittance values. Use NA if the mode is not known, or not applicable, e.g., for materials subject to internal scattering. The validity of computations related to thickness of the material or length of the light path depends on the availability and accuracy of the metadata.

Particles in suspension unlike dissolved **solutes** scatter light. Thus two different processes can attenuate light in liquid media: absorption and scattering. Coefficients of attenuation are always

306 setHowMeasured

based on measurements of internal absorbance or internal transmittance. In practice this is achieved by using as reference pure solvent in a vessel, such as a spectrometer cuvette, called *blank*. The measurement of the blank is done sequentially, before or after the *sample* of interest in single beam spectrophotometers and concurrently in double beam spectrophotometers. K.type describes the process of attenuation: "attenuation", "absorption" or "scattering", with "attenuation" used for cases of mixed modes of attenuation. Set K.type = NA if not available or unknown, or not applicable.

"specular" **reflectance** is defined as that measured by collecting the light reflected by the surface at the "mirror" of the angle of incidence; i.e., using a probe with a narrow angle of aperture. Usually measured close to normal angle of incidence. "total" **reflectance** is defined as that measured by collecting all the light reflected by the surface; i.e., using an integrating sphere. In a mirror, reflectance is mostly specular, while on the white surface of a sheet of paper scattering predominates. In the first case the value for total reflectance is not much more than for specular reflectance, while in the second case the difference is much larger as the "specular" component is much smaller.

```
## S3 method for class 'data.frame'
setHowMeasured(x, how.measured, ...)
## S3 method for class 'generic_mspct'
setHowMeasured(x, how.measured, ...)
```

Arguments

```
x a R object
... Allows use of additional arguments in methods for other classes.
how.measured, value
a list or a character string.
```

Value

x modified by reference.

Methods (by class)

- setHowMeasured(default): default
- setHowMeasured(generic_spct): generic_spct
- setHowMeasured(summary_generic_spct): summary_generic_spct
- setHowMeasured(data.frame): data.frame
- setHowMeasured(generic_mspct): generic_mspct

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not an object of a supported class, x is silently returned unchanged.

See Also

```

my.spct <- sun.spct
how_measured(my.spct)
how_measured(my.spct) <- "simulated with a radiation transfer model"
how_measured(my.spct)</pre>
```

308 setIdFactor

setIdFactor

Set the "idfactor" attribute

Description

Function to set, rename or unset by reference the "idfactor" attribute of an existing object of class generic_spct or an object of a class derived from generic_spct.

Usage

```
setIdFactor(x, idfactor)
id_factor(x) <- value</pre>
```

Arguments

```
x a generic_spct object.
```

idfactor, value character The name of a factor identifying multiple spectra stored longitudinally.

Details

If the attribute idfactor is already set, and a variable with name equal to the value passed as argument to idfactor does not exist in x, the currently set variable is renamed and the attribute value updated. If a variable named as the argument passed to idfactor exists in x, it will be set as id by storing this name in the attribute. If the value passed as argument to idfactor is NULL the attribute will be unset. If the attribute is not already set and there is no member variable in x with a name matching the argument passed to idfactor, an error is triggered.

Value

X

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a generic_spct or an object of a class derived from generic_spct, x is not modified.

See Also

Other idfactor attribute functions: getIdFactor()

Examples

```
my.spct <- sun_evening.spct
# inspecting
id_factor(sun.spct) # no idfactor set</pre>
```

setInstrDesc 309

```
id_factor(my.spct)
colnames(my.spct)

# renaming
id_factor(my.spct) <- "time"
getIdFactor(my.spct)
colnames(my.spct)

# removing
setIdFactor(my.spct, NULL)
getIdFactor(my.spct)
colnames(my.spct)</pre>
```

setInstrDesc

Set the "instr.desc" attribute

Description

Function to set by reference the "instr.desc" attribute of an existing generic_spct or derived-class object.

Usage

```
setInstrDesc(x, instr.desc)
instr_descriptor(x) <- value</pre>
```

Arguments

Value

X

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a generic_spct object, x is not modified.

The fields to be passed in the list instr.desc in part vary depending on the instrument brand and model.

310 setInstrSettings

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhenMeasured(), getWhenMeasured(), getWhenMeasured(), select_spct_attributes setFilterProperties(), setHowMeasured(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhenMeasured(), setWhenMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

setInstrSettings

Set the "instr.settings" attribute

Description

Function to set by reference the "what.measured" attribute of an existing generic_spct or derivedclass object.

Usage

```
setInstrSettings(x, instr.settings)
instr_settings(x) <- value</pre>
```

Arguments

```
x a generic_spct object instr.settings, value a list
```

Value

X

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a generic_spct object, x is not modified.

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhenMeasured(), getWhenMeasured(), getWhenMeasured(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes setFilterProperties(), setHowMeasured(), setInstrDesc(), setSoluteProperties(), setWhatMeasured(), setWhenMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

setKType 311

setKType

Set the "K.type" attribute

Description

Function to set by reference the "K.type" attribute of an existing solute_spct object

Usage

```
setKType(x, K.type = c("attenuation", "absorption", "scattering"))
```

Arguments

x a solute_spct or a summary_solute_spct object.

K. type character A string, either "attenuation", "absorption" or "scattering".

Value

X

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a solute_spct object, x is not modified The behaviour of this function is 'unusual' in that the default for parameter K.type is used only if x does not already have this attribute set.

See Also

```
Other K attribute functions: getKType()
```

Examples

```
print("missing example")
```

setMultipleWl

Set the "multiple.wl" attribute

Description

Function to set by reference the multiple.wl attribute of an existing generic_spct object or an object of a class derived from generic_spct.

312 setNormalized

Usage

```
setMultipleWl(x, multiple.wl = NULL)
multiple_wl(x) <- value</pre>
```

Arguments

Details

These methods set the attribute multiple.wl and if the argument of multiple.wl or value is NULL, they call findMultipleWl to obtain a guess. Pathological cases where multiple spectra in long form do not share any wavelength value underestimate the number of spectra, and require an explicit numeric argument. Calling these methods is very rarely needed in user code.

Value

x, modified in place by reference. If x is not a generic_spct or an object of a class derived from generic_spct, x is not modified.

See Also

Other multiple.wl attribute functions: getMultipleWl()

Examples

```
my.spct <- sun.spct
setMultipleWl(my.spct) # default is to search x, here my.spct
getMultipleWl(my.spct)

multiple_wl(my.spct) <- 1L # must be a valid value or NULL!
multiple_wl(my.spct)

multiple_wl(my.spct) <- NULL # must be a valid value or NULL!
multiple_wl(my.spct)</pre>
```

setNormalized

Set the "normalized" and "normalization" attributes

Description

Function to write the "normalized" attribute of an existing generic_spct object.

setNormalized 313

Usage

```
setNormalized(
  norm = FALSE,
 norm.type = NA_character_,
 norm.factors = NA_real_,
 norm.cols = NA_character_,
  norm.range = rep(NA_real_, 2),
  verbose = getOption("verbose_as_default", default = FALSE)
)
setNormalised(
  Х,
  norm = FALSE,
  norm.type = NA_character_,
  norm.factors = NA_real_,
  norm.cols = NA_character_,
 norm.range = rep(NA_real_, 2),
  verbose = getOption("verbose_as_default", default = FALSE)
)
```

Arguments

Χ	a generic_spct object.
norm	numeric (or logical) Normalization wavelength (nanometres).
norm.type	character Type of normalization applied.
norm.factors	numeric The scaling factor(s) so that dividing the spectral values by this factor reverts the normalization.
norm.cols	character The name(s) of the data columns normalized.
norm.range	numeric The wavelength range used for normalization (nm).
verbose	logical Flag enabling or silencing informative warnings.

Details

This function **is used internally**, although occasionally users may want to use it to "pretend" that spectral data have not been normalized. Use normalize() methods to apply a normalization and set the attributes accordingly. Function setNormalized() only sets the attributes that store the metadata corresponding to an already applied normalization. Thus a trace of the transformations applied to spectral data is kept, which currently is used to renormalize the spectra when the quantity used for expression is changed with a conversion function. It is also used in other packages like 'ggspectra' when generating automatically axis labels. If x is not a generic_spct object, x is not modified.

Note

Passing a logical as argument to norm is deprecated but accepted silently for backwards compatibility.

314 setResponseType

setNormalised() is a synonym for this setNormalized() method.

See Also

```
Other rescaling functions: fscale(), fshift(), getNormalized(), getScaled(), is_normalized(), is_scaled(), normalize(), setScaled()
```

setResponseType

Set the "response.type" attribute

Description

Functions to set by reference the "response.type" attribute of an existing response_spct object, and to query its value.

Usage

```
setResponseType(x, response.type = c("response", "action"))
getResponseType(x)
```

Arguments

```
x a response_spct object
response.type a character string, either "response" or "action"
```

Details

Objects of class response_spct() can contain data for a response spectrum or an action spectrum. Response spectra are measured using the same photon (or energy) irradiance at each wavelength. Action spectra are derived from dose response curves at each wavelength, and responsivity at each wavelength is expressed as the reciprocal of the photon fluence required to obtain a fixed level of response. In the case of biological systems the action and response spectra frequently differ in their shape and spectral values. This is a property inherent to a data set and not subject to conversions, thus normally set when a response_spct object is created and never modified.

Value

X

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a response_spct object, x is not modified The behaviour of this function is 'unusual' in that the default for parameter response. type is used only if x does not already have this attribute set.

setRfrType 315

Examples

```
my.spct <- ccd.spct
setResponseType(my.spct, "action")
getResponseType(ccd.spct)
getResponseType(sun.spct)</pre>
```

setRfrType

The "Rfr.type" attribute

Description

Function to set by reference the "Rfr. type" attribute of an existing reflector_spct or object_spct object, and function to query its current status.

Usage

```
setRfrType(x, Rfr.type = c("total", "specular"))
getRfrType(x)
```

Arguments

```
x a reflector_spct or an object_spct object.

Rfr.type character String, either "total" or "specular".
```

Details

Reflectance can be measured by collecting the light reflected out of a surface in all directions, using an integrating sphere, obtaining a quantity called total reflectance. If instead, the reflected light is collected at a narrow angle mirroring the incident angle, only part of the reflected radiation is collected, corresponding to mirror-like reflection, called specular. Thus,

$$\rho = \rho_s + \rho_d$$

where, ρ is total reflectance, and its components, ρ_s , specular reflectance, and ρ_d , diffuse or scattered reflectance. When strong scattering takes place, total reflectance can be much more than the specular component. In most cases ρ_d is not measured directly.

The distinction depends on the measuring procedure, and this information is stored as metadata in an attribute of objects of classes reflector_spct or an object_spct.

When converting between internal and total transmittance, or computing absorptance by difference based on transmittance and reflectance, only total reflectance can be meaningfully used (if the object does not noticeably scatter light, it may be possible to assume that specular reflectance represents most of the total reflectance.) Consequently, checking the stored value of this attribute is used as a safeguard in these computations.

This attribute is normally set when the source_spct object is created.

316 setScaled

Value

x, with the modified attribute in the case of setRfrType() or the character value, "total" or "specular", stored in the "Rfr.type" attribute of x in the case of getRfrType(). If x is not a reflector_spct or an object_spct object, NA is returned.

Note

Function setRfrType() alters x itself by reference and in addition returns x invisibly. If x is not a reflector_spct or an object_spct object, x is not modified. The behaviour of this function is 'unusual' in that the default for parameter Rfr.type is used only if x does not already have this attribute set.

See Also

```
reflector_spct and object_spct.
```

Examples

```
my.spct <- reflector_spct(w.length = 400:409, Rfr = 0.1)
getRfrType(my.spct)
setRfrType(my.spct, "specular")
getRfrType(my.spct)</pre>
```

setScaled

Set the "scaled" attribute

Description

Function to write the "scaled" attribute of an existing generic_spct object.

```
setScaled(x, ...)
## Default S3 method:
setScaled(x, ...)
## S3 method for class 'generic_spct'
setScaled(x, ..., scaled = FALSE)
## S3 method for class 'summary_generic_spct'
setScaled(x, ..., scaled = FALSE)
## S3 method for class 'generic_mspct'
setScaled(x, ..., scaled = FALSE)
```

setSoluteProperties 317

Arguments

x a generic_spct object.

... currently ignored.

scaled logical with FALSE meaning that values are expressed in absolute physical units

and TRUE meaning that relative units are used. If NULL the attribute is not modi-

fied.

Value

```
a new object of the same class as x.
```

a new object of the same class as x.

a new object of the same class as x.

a new object of the same class as x.

Methods (by class)

- setScaled(default): Default for generic function
- setScaled(generic_spct): Specialization for generic_spct
- setScaled(summary_generic_spct): Specialization for summary_generic_spct
- setScaled(generic_mspct): Specialization for generic_mspct

Note

if x is not a generic_spct object, x is not modified.

See Also

```
Other rescaling functions: fscale(), fshift(), getNormalized(), getScaled(), is_normalized(), is_scaled(), normalize(), setNormalized()
```

setSoluteProperties

Set the "solute.properties" attribute

Description

Function to set by reference the "solute.properties" attribute of an existing solute_spct object.

318 setSoluteProperties

Usage

```
setSoluteProperties(
  solute.properties = NULL,
  pass.null = FALSE,
 mass = NA_real_,
  formula = NULL,
  structure = grDevices::as.raster(matrix()),
  name = NA_character_,
  ID = NA_character_,
  solvent.name = NA_character_,
  solvent.ID = NA_character_
)
solute_properties(x) <- value</pre>
```

Arguments

solute spct A spectrum of coefficients of attenuation.

solute.properties, value

a list with fields named "mass", "formula", "structure", "name" and "ID".

pass.null logical If TRUE, the parameters to the next three parameters will be always ig-

nored, otherwise they will be used to build an object of class "solute.properties"

when the argument to solute.properties is NULL.

numeric The mass in Dalton $[Da = q \, mol^{-1}].$ mass

formula character The molecular formula.

raster A bitmap of the structure. structure

name, solvent.name

character The name of the substance and the name of the solvent. A named character vector, with member names such as "IUPAC" for the authority.

ID. solvent.ID character The names of the substance and of the solvent. A named character

vector, with member names such as "ChemSpider" or "PubChen" for the author-

ity.

Details

Storing solute properties allows inter-conversion between bases of expression, and ensures the unambiguous identification of the substances to which the spectral data refer. These properties make it possible to compute filter_spct objects for solutions of the solute, i.e., absorption spectra of liquid filters. The parameter pass.null makes it possible to remove the attribute. The solvent used for the determination of the attenuation coefficient is important metadata as the solvent can alter the spectral ansorption properties of the solute.

Value

setTfrType 319

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a filter_spct object, x is not modified.

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setWhatMeasured(), setWhenMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

Examples

setTfrType

The "Tfr.type" attribute

Description

Function to set by reference the "Tfr.type" attribute of an existing filter_spct or object_spct object, and function to query its current status.

```
setTfrType(x, Tfr.type = c("total", "internal"))
getTfrType(x)
```

Arguments

x a filter_spct or an object_spct object.

Tfr.type character string, either "total" or "internal".

Details

Transmittance, T or τ , has two different definitions that differ in how reflectance is taken into account: "total" transmittance and "internal" transmittance. They are both in widespread use, and rather frequently the interconversion is approximate or even not possible.

$$T = \frac{I_z}{I_0}$$

$$\tau = \frac{I_z}{I_0 - \rho}$$

where T is total transmittance and τ is internal transmittance; I_0 is the radiant power incident on an object and I_z is the radiant power at depth z, in most cases measured below the non-illuminated side of the object, and ρ is the total reflectance at the illuminated surface.

The transmittance of an object as a whole depends on the length of the light path within the object and reflectance on the angle of incidence of the light on the surface. When the light beam is near-normal to the surface, both quantities are at their minimum.

Thus, the interconversion of total spectral transmittance, $T(\lambda)$, into internal spectral transmittance, $\tau(\lambda)$, is strictly possible only if the spectral reflectance $\rho(\lambda)$ is known. In practice, the spectral reflectance is approximated by a constant value that is assumed independent of wavelength.

Objects of class object_spct contain spectral data for both spectral transmittance and spectral reflectance or spectral absorptance, making conversion possible. Objects of class filter_spct do not contain spectral reflectance data, but may have a known approximate value for a reflectance constant, but this is frequently not the case.

The type of transmittance data stored in an object of these classes is recorded as metadata in attribute Tfr. Type. The functions described here set and query this attribute. Contrary to directly accessing the attribute, the query function consistently returns NA both when the attribute is set to NA and when the attribute has not been set, as can be the case of objects created with early versions of the package.

Absorptance, α , and absorbance, A, are normally given as "internal", and this is the assumption in this package. However, as in some cases strict enforcement would prevent conversions, this is not strictly enforced. (IUPAC, recommends use of the name *attenuance* (formerly *extinction*) instead of *absorbance* when light attenuation involves processes other than pure absorption, such as scattering and luminescence.)

$$1 = \alpha + \rho + \tau$$

$$A_{10} = \log_{10} \frac{1}{\alpha} = -\log_{10} \alpha$$

When a solvent-only *blank* is used when measuring the absorbance of a solution, the absorbance is not only "internal" to the solution (discounting reflections at the cuvette boundaries) but also

setTimeUnit 321

discounts the effect of the solvent itself. When measuring solid samples, like a sheet of glass, in most cases a blank is not available.

For semitransparent objects like glass, it is important to take into account that reflections occur at each interface between substances with different refractive index.

This attribute is normally set when the source_spct object is created. But convertTfrType() updates it when it changes due to a conversion.

Value

x, with the modified attribute in the case of setTfrType() or the character value, "total" or internal, stored in the "Tfr.type" attribute of x in the case of getTfrType(). If x is not a filter_spct or an object_spct object, NA is returned.

Note

Function setTfrType() alters x itself by reference and in addition returns x invisibly. If x is not a filter_spct or an object_spct object, x is not modified. The behaviour of this function is 'unusual' in that the default for parameter Tfr. type is used only if x does not already have this attribute set.

See Also

```
convertTfrType, filter_spct, and object_spct.
```

Examples

```
my.spct <- polyester.spct
getTfrType(my.spct)
setTfrType(my.spct, "internal")
getTfrType(my.spct)</pre>
```

setTimeUnit

Set the "time.unit" attribute of an existing source_spct object

Description

Function to set by reference the "time.unit" attribute

```
setTimeUnit(
   x,
   time.unit = c("second", "hour", "day", "exposure", "none"),
   override.ok = FALSE
)
```

322 setWhatMeasured

Arguments

X	a source_spct object
time.unit	character string indicating the time unit used for spectral irradiance or exposure ("second", "day" or "exposure") or an object of class duration as defined in package lubridate.
override.ok	logical Flag that can be used to silence warning when overwriting an existing attribute value (used internally)

Value

X

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a source_spct or response_spct object, x is not modified. The behaviour of this function is 'unusual' in that the default for parameter time.unit is used only if x does not already have this attribute set. time.unit = "hour" is currently not fully supported.

See Also

```
Other time attribute functions: checkTimeUnit(), convertThickness(), convertTimeUnit(), getTimeUnit()
```

Examples

```
my.spct <- sun.spct
setTimeUnit(my.spct, time.unit = "second")
setTimeUnit(my.spct, time.unit = lubridate::duration(1, "seconds"))</pre>
```

setWhatMeasured

Set the "what.measured" attribute

Description

Function to set by reference the "what.measured" attribute of an existing generic_spct, generic_mspct, summary_generic_spct, data.frame or a derived-class object.

```
setWhatMeasured(x, ...)
what_measured(x) <- value

## Default S3 method:
setWhatMeasured(x, what.measured, ...)</pre>
```

setWhatMeasured 323

```
## S3 method for class 'generic_spct'
setWhatMeasured(x, what.measured, ...)

## S3 method for class 'summary_generic_spct'
setWhatMeasured(x, what.measured, ...)

## S3 method for class 'data.frame'
setWhatMeasured(x, what.measured, ...)

## S3 method for class 'generic_mspct'
setWhatMeasured(x, what.measured, ...)
```

Arguments

```
x a generic_spct object
... Allows use of additional arguments in methods for other classes.
what.measured, value
a list
```

Value

X

Methods (by class)

- setWhatMeasured(default): default
- setWhatMeasured(generic_spct): generic_spct
- setWhatMeasured(summary_generic_spct): summary_generic_spct
- setWhatMeasured(data.frame): data.frame
- setWhatMeasured(generic_mspct): generic_mspct

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a generic_spct object, x is not modified.

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhenMeasured(), getWhenMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhenMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

324 setWhenMeasured

Examples

```
my.spct <- sun.spct
what_measured(my.spct)
what_measured(my.spct) <- "Sun"
what_measured(my.spct)</pre>
```

setWhenMeasured

Set the "when.measured" attribute

Description

Function to set by reference the "when" attribute of an existing generic_spct, generic_mspct, summary_generic_spct, data.frame or a derived-class object.

Usage

```
setWhenMeasured(x, when.measured, ...)
when_measured(x) <- value

## Default S3 method:
setWhenMeasured(x, when.measured, ...)

## S3 method for class 'generic_spct'
setWhenMeasured(x, when.measured = lubridate::now(tzone = "UTC"), ...)

## S3 method for class 'summary_generic_spct'
setWhenMeasured(x, when.measured = lubridate::now(tzone = "UTC"), ...)

## S3 method for class 'data.frame'
setWhenMeasured(x, when.measured = lubridate::now(tzone = "UTC"), ...)

## S3 method for class 'generic_mspct'
setWhenMeasured(x, when.measured = lubridate::now(tzone = "UTC"), ...)</pre>
```

Arguments

```
    x a generic_spct object
    when.measured, value
    POSIXct to add as attribute, or a list of POSIXct.
    ... Allows use of additional arguments in methods for other classes.
```

Value

Х

setWhereMeasured 325

Methods (by class)

- setWhenMeasured(default): default
- setWhenMeasured(generic_spct): generic_spct
- setWhenMeasured(summary_generic_spct): summary_generic_spct
- setWhenMeasured(data.frame): data.frame
- setWhenMeasured(generic_mspct): generic_mspct

Note

This method alters x itself by reference and in addition returns x invisibly. If x is not a generic_spct or an object of a class derived from generic_spct, x is not modified. If when is not a POSIXct object or NULL an error is triggered. A POSIXct describes an instant in time (date plus time-of-day plus time zone).

Be aware that lubridate::ymd() returns an incompatible Date object while lubridate::ymd_h(), lubridate::ymd_hm() and lubridate::ymd_hms() and similar functions return objects of class POSIXct acceptable as arguments for parameter when.measured.

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

Examples

```
my.spct <- sun.spct
when_measured(my.spct)
when_measured(my.spct) <- lubridate::ymd_hms("2020-01-01 08:00:00")
when_measured(my.spct)</pre>
```

setWhereMeasured

Set the "where.measured" attribute

Description

Function to set by reference the "where measured" attribute of an existing generic_spct, generic_mspct, summary_generic_spct, data frame or a derived-class object.

326 setWhereMeasured

Usage

```
setWhereMeasured(x, where.measured, lat, lon, address, ...)
where_measured(x) <- value

## Default S3 method:
setWhereMeasured(x, where.measured, lat, lon, address, ...)

## S3 method for class 'generic_spct'
setWhereMeasured(x, where.measured = NA, lat = NA, lon = NA, address = NA, ...)

## S3 method for class 'summary_generic_spct'
setWhereMeasured(x, where.measured = NA, lat = NA, lon = NA, address = NA, ...)

## S3 method for class 'data.frame'
setWhereMeasured(x, where.measured = NA, lat = NA, lon = NA, address = NA, ...)

## S3 method for class 'generic_mspct'
setWhereMeasured(x, where.measured = NA, lat = NA, lon = NA, address = NA, ...)</pre>
```

Arguments

x a generic_spct object

where.measured, value

A one row data.frame such as returned by function geocode from package

'ggmap' for a location search.

lat numeric Latitude in decimal degrees North

lon numeric Longitude in decimal degrees West

address character Human readable address

... Allows use of additional arguments in methods for other classes.

Value

X

Methods (by class)

- setWhereMeasured(default): default
- setWhereMeasured(generic_spct): generic_spct
- setWhereMeasured(summary_generic_spct): summary_generic_spct
- setWhereMeasured(data.frame): data.frame
- setWhereMeasured(generic_mspct): generic_mspct

shared_member_class 327

Note

This method alters x itself by reference and in addition returns x invisibly. If x is not a generic_spct or an object of a class derived from generic_spct, x is not modified. If where is not a POSIXct object or NULL an error is triggered. A POSIXct describes an instant in time (date plus time-of-day plus time zone). As expected passing NULL as argument for where measured unsets the attribute.

Method for collections of spectra recycles the location information only if it is of length one.

where_measured(my.spct) <- data.frame(lon = 0, lat = -60)
where_measured(my.spct)</pre>
```

shared_member_class

Classes common to all collection members.

Description

Finds the set intersection among the class attributes of all collection member as a target set of class names.

Usage

```
shared_member_class(1, target.set = spct_classes())
```

Arguments

a list or a generic_mspct object or of a derived class.

target.set character The target set of classes within which to search for classes common to all members.

Value

A character vector containing the class attribute values.

See Also

Other set and unset 'multi spectral' class functions: rmDerivedMspct()

328 slash-.generic_spct

sign Sign

Description

sign returns a vector with the signs of the corresponding elements of x (the sign of a real number is 1, 0, or -1 if the number is positive, zero, or negative, respectively).

Usage

```
## S3 method for class 'generic_spct'
sign(x)
```

Arguments

x an object of class "generic_spct"

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), convolve_each(), div-.generic_spct, log(), minus-.generic_spct, mod-.generic_spct, plus-.generic_spct, round(), slash-.generic_spct, times-.generic_spct
```

slash-.generic_spct Arithmetic Operators

Description

Division operator for generic spectra.

Usage

```
## S3 method for class 'generic_spct'
e1 / e2
```

Arguments

```
e1 an object of class "generic_spct"
e2 an object of class "generic_spct"
```

See Also

```
Other math operators and functions: MathFun, ^.generic_spct(), convolve_each(), div-.generic_spct, log(), minus-.generic_spct, mod-.generic_spct, plus-.generic_spct, round(), sign(), times-.generic_spct
```

smooth_spct 329

smooth_spct

Smooth a spectrum

Description

These functions implement one original methods and acts as a wrapper for other common R smoothing functions. The advantage of using this function for smoothing spectral objects is that it simplifies the user interface and sets, when needed, defaults suitable for spectral data.

Usage

```
smooth_spct(x, method, strength, wl.range, ...)
## Default S3 method:
smooth_spct(x, method, strength, wl.range, ...)
## S3 method for class 'source_spct'
smooth_spct(
  Х,
 method = "custom",
  strength = 1,
 wl.range = NULL,
  na.rm = FALSE,
)
## S3 method for class 'filter_spct'
smooth_spct(
 Х,
 method = "custom",
  strength = 1,
 wl.range = NULL,
  na.rm = FALSE,
)
## S3 method for class 'reflector_spct'
smooth_spct(
  Х,
  method = "custom",
  strength = 1,
 wl.range = NULL,
  na.rm = FALSE,
)
## S3 method for class 'solute_spct'
```

smooth_spct

```
smooth_spct(
  х,
 method = "custom",
  strength = 1,
 wl.range = NULL,
 na.rm = FALSE,
)
## S3 method for class 'response_spct'
smooth_spct(
 х,
 method = "custom",
 strength = 1,
 wl.range = NULL,
 na.rm = FALSE,
)
## S3 method for class 'cps_spct'
smooth_spct(
 х,
 method = "custom",
 strength = 1,
 wl.range = NULL,
 na.rm = FALSE,
)
## S3 method for class 'generic_mspct'
smooth_spct(
 х,
 method = "custom",
  strength = 1,
 wl.range = NULL,
 na.rm = FALSE,
)
```

Arguments

x an R object.

method a character string "custom", "lowess", "supsmu" or "skip"..

strength numeric value to adjust the degree of smoothing. Ignored if method-specific parameters are passed through

wl.range any R object on which applying the method range() yields a vector of two numeric values, describing a range of wavelengths (nm) within which spectral data is to be smoothed. NA is interpreted as the min or max value of x[[w.length]].

... other parameters passed to the underlying smoothing functions.

na.rm logical A flag indicating whether NA values should be stripped before the computation proceeds.

Value

A copy of x with spectral data values replaced by smoothed ones.

Methods (by class)

- smooth_spct(default): Default for generic function
- smooth_spct(source_spct): Smooth a source spectrum
- smooth_spct(filter_spct): Smooth a filter spectrum
- smooth_spct(reflector_spct): Smooth a reflector spectrum
- smooth_spct(solute_spct): Smooth a solute attenuation spectrum
- smooth_spct(response_spct): Smooth a response spectrum
- smooth_spct(cps_spct): Smooth a counts per second spectrum
- smooth_spct(generic_mspct):

Note

Method "custom" is our home-brewed method which applies strong smoothing to low signal regions of the spectral data, and weaker or no smoothing to the high signal areas. Values very close to zero are set to zero with a limit which depends on the local variation. This method is an ad-hock method suitable for smoothing spectral data obtained with spectrometers. In the cased of methods "lowess" and "supsmu" the current function behaves like a wrapper of the functions of the same names from base R. Method "skip" returns x unchanged.

Examples

```
my.spct <- clip_wl(sun.spct, c(400, 500))
smooth_spct(my.spct)
smooth_spct(my.spct, method = "custom", strength = 1)
smooth_spct(my.spct, method = "custom", strength = 4)
smooth_spct(my.spct, method = "supsmu", strength = 4)</pre>
```

source_spct

Spectral-object constructors

Description

These constructor functions can be used to create spectral objects derived from generic_spct. They take as arguments numeric vectors for the wavelengths and spectral data, and numeric, character, and logical values for metadata attributes to be saved to the objects created and options controlling the creation process.

Usage

```
source_spct(
 w.length = NULL,
  s.e.irrad = NULL,
  s.q.irrad = NULL,
  time.unit = c("second", "day", "exposure"),
  bswf.used = c("none", "unknown"),

 idfactor = NULL
)
```

Arguments

w. length numeric vector with wavelengths in nanometres [nm].

s.e.irrad	numeric vector with spectral energy irradiance in $[W m^{-2} nm^{-1}]$ or $[J d^{-1} m^{-2} nm^{-1}]$.
s.q.irrad	numeric A vector with spectral photon irradiance in $[mol s^{-1} m^{-2} nm^{-1}]$ or $[mol d^{-1} m^{-2} nm^{-1}]$.
• • • •	other arguments passed to tibble() such as vectors or factors to be added as additional columns.
time.unit	character string indicating the time unit used for spectral irradiance or exposure ("second", "day" or "exposure") or an object of class duration as defined in package lubridate.
bswf.used	character A string indicating the BSWF used, if any, for spectral effective irradiance or exposure ("none" or the name of the BSWF).
comment	character A string to be added as a comment attribute to the object created.
strict.range	logical Flag indicating whether off-range values result in an error instead of a warning.
multiple.wl	numeric Maximum number of repeated w.length entries with same value. (As with multiple spectra stored in long from).
idfactor	character Name of factor distinguishing multiple spectra when stored longitudinally (required if $multiple.wl > 1$).
irrad.mult	numeric vector with multipliers for each detector pixel expressed in units of $Wm^{-2}nm^{-1}n^{-1}s$, where ns^{-1} are detector counts per second.
instr.desc	a list describing the spectrometer used to acquire the data.
counts	numeric vector with raw counts expressed per scan.
instr.settings	a list describing the settings used to acquire the data.
cps	numeric vector with linearized raw counts expressed per second $[n s^{-1}]$
s.e.response	numeric vector with a biological, chemical or physical response expressed per unit spectral energy irradiance [$W m^{-2} nm^{-1}$ or $J d^{-1} m^{-2} nm^{-1}$].
s.q.response	numeric vector with a biological, chemical or physical response expressed per unit spectral photon irradiance in $[mol\ s^{-1}\ m^{-2}\ nm^{-1}]$ or $mol\ d^{-1}\ m^{-2}\ nm^{-1}]$.
response.type	a character string, either "response" or "action".
Tfr	numeric vector with spectral transmittance as fraction of one $[/1]$.
Трс	numeric vector with spectral transmittance as percent values
Afr	numeric vector of absorptance as fraction of one $[/1]$.
Α	numeric vector of absorbance values (log_{10} -base a.u.)
Tfr.type	character string indicating whether transmittance and absorptance values are "total" or "internal" values
Rfr.constant	numeric The value of the reflection factor $[/1]$.
thickness	numeric The thickness of the material.
attenuation.mod	de character One of "reflection", "absorption" or "mixed".
Rfr	numeric vector with spectral reflectance as fraction of one [/1].
	numeric vector with spectral reflectance as fraction of one [/1]. numeric vector with spectral reflectance as percent values.
Rpc	numeric vector with spectral refrectance as percent values.

Rfr. type character A string, either "total" or "specular".

K.mole numeric vector with molar attenuation coefficient in SI units $[m^2 \ mol^-1]$. K.mass numeric vector with mass attenuation coefficient in SI units $[m^2 \ q^-1]$.

attenuation.XS numeric vector with attenuation cross section values (Converted during object

construction into K.mole.)

log.base numeric Normally one of e or 10. Data are stored always on base 10 correspond-

ing to decadal absorbance as used in chemistry.

K.type character A string, either "attenuation", "absorption" or "scattering".

name, solvent.name

character The names of the substance and of the solvent. A named character

vector, with member names such as "IUPAC" for the authority.

mass numeric The molar mass in Dalton [Da] ($Da = g \, mol^{-1}$).

formula character The molecular formula.
structure raster A bitmap of the structure.

ID, solvent. ID character The ID of the substance and of the solvent. A named character vector,

with member names such as "ChemSpider" or "PubChem" for the authority.

x, y, z numeric colour coordinates

Details

Constructors can be used to create spectral objects from spectral quantities expressed on a single base or unit. Some of the functions have different formal parameters accepting a quantity expressed in different units, however, an argument can be passed to only one of these formal parameters in a given call. The constructors object_spct() and chroma_spct() require arguments to be passed for multiple but distinct spectral quantities.

Value

A object of class generic_spct or a class derived from it, depending on the function used. In other words an object of a class with the same name as the constructor function.

Warning for filter_spct!

Not entering metadata when creating an object will limit the available operations! While "internal" transmittance is defined as the transmittance of the material body itself, "total" transmittance includes the effects of surface reflectance on the amount of light transmitted. For non-diffusing materials like glass an approximate Rfr.constant value can be used to convert "total" into "internal" transmittance values and vice versa. Use NA if not known, or not applicable, e.g., for materials subject to internal scattering.

Warning for solute_spct!

You should always set the base for logarithms to match that on which the absorbance data are expressed. Failing to do this will result in bad data and all further computation will be wrong. Not entering metadata when creating an object will limit the available operations! Mass should be indicated in daltons or $g \, mol^{-1}$. The SI unit of molar attenuation coefficient is the square metre

spct_attr2tb 337

per mole $(m^2 \, mol^1)$, but in practice, quantities are usually expressed in terms of $M^{-1} \, cm^{-1}$ or $l \, mol^{-1} \, cm^{-1}$ (the latter two units are both equal to 0.1 $m^2 \, mol^{-1}$ and quantities expressed in them need to be divided by 10 when passed as arguments to K.mole.).

```

spct_attr2tb

Copy attributes into a tibble

Description

Method returning attributes of an object of class generic_spct or derived, or of class waveband. Only attributes defined and/or set by package 'photobiology' for objects of the corresponding class are returned.

Usage

```
spct_attr2tb(
    x,
    which = c("-", "names", "row.names", "spct.tags", "spct.version", "comment"),
    ...
)
```

Arguments

```
x a generic_spct object.
which character vector Names of attributes to retrieve.
... currently ignored
```

Value

A tibble with the values stored in the attributes whose names were selected through the argument to which if present in x.

See Also

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_metadata(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

spct_metadata

spct_classes

Function returning a vector containing the names of spectra classes.

Description

Function returning a vector containing the names of spectra classes.

Usage

```
spct_classes()
```

Value

A character vector of class names.

Examples

```
spct_classes()
```

spct_metadata

Access metadata

Description

Return metadata attributes from a single spectrum or a collection of spectra as a tibble.

Usage

```
spct_metadata(
    x,
    col.names = NULL,
    idx = "spct.idx",
    na.rm = is.null(col.names),
    unnest = TRUE
)
```

Arguments

Х	generic_mspct or generic_spct Any collection of spectra or spectrum.
col.names	named character vector Name(s) of column(s) to create.
idx	character Name of the column with the names of the members of the collection of spectra.
na.rm	logical Flag controlling deletion of columns containing only NA values.
unnest	logical Flag controlling if metadata attributes that are lists of values should be returned in a list column or in separate columns.

spct_wide2long 339

Details

Attributes are returned as columns in a tibble. If the argument to col.names is a named vector, with the names of members matching the names of attributes, then the values are used as names for the columns created. This permits setting any valid name for the new columns. If the vector passed to col.names has no names, then the values are interpreted as the names of the attributes to add, and also used as names for the new columns.

Some metadata values are stored in lists or data frames, these can be returned as a list columns or the individual fields unnested into separate columns.

Value

A tibble With the metadata attributes and an index column.

See Also

```
add_attr2tb for more details.
```

```
Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), subset_attributes(), trimInstrDesc(), trimInstrSettings()
```

Examples

```

spct_metadata(my.mspct)
spct_metadata(sun.spct)
spct_metadata(my.mspct, na.rm = TRUE)
spct_metadata(sun.spct, na.rm = TRUE)
spct_metadata(my.mspct, col.names = c(geocode = "geo", "instr.desc"))
spct_metadata(sun.spct, col.names = c(geocode = "geo", "instr.desc"))
spct_metadata(sun.spct, col.names = "where.measured")$where.measured</pre>
```

spct_wide2long

Convert spectrum from wide to long form

Description

Convert spectrum from wide to long form

340 spct_wide2long

Usage

```
spct_wide2long(
   spct,
   fixed.cols = "w.length",
   idfactor = "spct.idx",
   rm.spct.class = FALSE,
   ...
)
```

Arguments

spct An object with spectral data.

fixed.cols character Names of variables that should be copied unchanged for each spec-

trum.

idfactor character The name of the factor to be added to the long-form object and used

to store the original name of the columns as an index to the different spectra.

rm.spct.class logical If true the returned object is a data frame.

... Currently ignored.

Details

Only objects of classes raw_spct, cps_spct, and object_spct normally contain multiple columns of spectral data. These are supported as well as generic_spct. Is the wide spectra contain multiple spectra in long form, the original idfactor is preserved.

Spectra that are already in long form, if passed as argument, are returned unchanged.

Because the classes defined for spectra have a well defined format, and known column names we can define a rather simple function for this operation.

Value

An object of the same class as spct or a data. frame with derived classes removed.

Examples

```
spct_wide2long(white_led.raw_spct)
spct_wide2long(white_led.cps_spct)
spct_wide2long(Ler_leaf.spct)
```

spikes

Spikes

Description

Function that returns a subset of an R object with observations corresponding to spikes. Spikes are values in spectra that are unusually high compared to neighbors. They are usually individual values or very short runs of similar "unusual" values. Spikes caused by cosmic radiation are a frequent problem in Raman spectra. Another source of spikes are "hot pixels" in CCD and diode arrays.

Usage

```
spikes(x, z.threshold, max.spike.width, na.rm, ...)
## Default S3 method:
spikes(x, z.threshold = NA, max.spike.width = 8, na.rm = FALSE, ...)
## S3 method for class 'numeric'

 z.threshold = 9,
 max.spike.width = 8,
 na.rm = FALSE,
  ...,
 var.name = "counts",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

x an R object

z.threshold numeric Modified Z values larger than z.threshold are considered to corre-

spond to spikes.

max.spike.width

integer Wider regions with high Z values are not detected as spikes.

na.rm logical indicating whether NA values should be stripped before searching for

spikes.

... ignored var.name, y.var.name

character Name of column where to look for spikes.

unit.out character One of "energy" or "photon"

filter.gty character One of "transmittance" or "absorbance"

. parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

Spikes are detected based on a modified Z score calculated from the differenced spectrum. The Z threshold used should be adjusted to the characteristics of the input and desired sensitivity. The lower the threshold the more stringent the test becomes, resulting in most cases in more spikes being detected. A modified version of the algorithm is used if a value different from NULL is passed as argument to max.spike.width. In such a case, an additional step filters out broader spikes (or falsely detected steep slopes) from the returned values.

When the argument passed to x contains multiple spectra, the spikes are searched for in each spectrum independently of other spectra.

Value

A subset of the object passed as argument to x with rows corresponding to spikes.

Methods (by class)

- spikes(default): Default returning always NA.
- spikes(numeric): Default function usable on numeric vectors.
- spikes(data.frame): Method for "data.frame" objects.
- spikes(generic_spct): Method for "generic_spct" objects.
- spikes(source_spct): Method for "source_spct" objects.
- spikes(response_spct): Method for "response_spct" objects.
- spikes(filter_spct): Method for "filter_spct" objects.
- spikes(reflector_spct): Method for "reflector_spct" objects.

346 split2mspct

- spikes(solute_spct): Method for "solute_spct" objects.
- spikes(cps_spct): Method for "cps_spct" objects.
- spikes(raw_spct): Method for "raw_spct" objects.
- spikes(generic_mspct): Method for "generic_mspct" objects.
- spikes(source_mspct): Method for "source_mspct" objects.

split2mspct

Convert a 'wide' or untidy data frame into a collection of spectra

Description

Convert a data frame object into a "multi spectrum" object by constructing a an object of a multi-spet class, converting numeric columns other than wavelength into individual spet objects.

Usage

```
split2mspct(
    x,
    member.class = NULL,
    spct.data.var = NULL,
    w.length.var = "w.length",
    idx.var = NULL,
    ncol = 1,
    byrow = FALSE,
    ...
)
```

split2mspct 347

```
split2source_mspct(
  spct.data.var = "s.e.irrad",
 w.length.var = "w.length",
 idx.var = NULL,
 ncol = 1,
 byrow = FALSE,
)
split2response_mspct(
 spct.data.var = "s.e.response",
 w.length.var = "w.length",
 idx.var = NULL,
 ncol = 1,
 byrow = FALSE,
)
split2filter_mspct(
 spct.data.var = "Tfr",
 w.length.var = "w.length",
 idx.var = NULL,
 ncol = 1,
 byrow = FALSE,
)
split2reflector_mspct(
  spct.data.var = "Rfr",
 w.length.var = "w.length",
 idx.var = NULL,
 ncol = 1,
 byrow = FALSE,
)
split2solute_mspct(
 spct.data.var = "K.mole",
 w.length.var = "w.length",
 idx.var = NULL,
  ncol = 1,
  byrow = FALSE,
```

348 split2mspct

```
)
split2cps_mspct(
  spct.data.var = "cps",
 w.length.var = "w.length",
  idx.var = NULL,
  ncol = 1,
 byrow = FALSE,
)
split2raw_mspct(
  spct.data.var = "count",
 w.length.var = "w.length",
  idx.var = NULL,
  ncol = 1,
  byrow = FALSE,
)
split2calibration_mspct(
  spct.data.var = "irrad.mult",
 w.length.var = "w.length",
  idx.var = NULL,
  ncol = 1,
 byrow = FALSE,
)
```

Arguments

Χ	data frame
member.class	character Class of the collection members
spct.data.var	$characterName\ of\ the\ spectral\ data\ argument\ in\ the\ object\ constructor\ for\ member\ .\ class$
w.length.var	character Name of column containing wavelength data in nanometres
idx.var	character Name of column containing data to be copied unchanged to each spct
	object
ncol	integer Number of 'virtual' columns in data
byrow	logical If ncol > 1 how to read in the data
	additional named arguments passed to the member constructor function.

split_bands 349

as.reflector_mspct(), as.response_mspct(), as.solute_mspct(), as.source_mspct(), subset2mspct()

split_bands

List-of-wavebands constructor

Description

Build a list of unweighted "waveband" objects that can be used as input when calculating irradiances.

Usage

```
split_bands(
    x,
    list.names = NULL,
    short.names = is.null(list.names),
    length.out = NULL
)
```

Arguments

x	a numeric vector of wavelengths to split at (nm), or a range of wavelengths or a generic_spct or a waveband.
list.names	character vector with names for the component wavebands in the returned list (in order of increasing wavelength)
short.names	logical indicating whether to use short or long names for wavebands
length.out	numeric giving the number of regions to split the range into (ignored if w.length is not numeric).

Value

an un-named list of waveband objects

Note

list.names is used to assign names to the elements of the list, while the waveband objects themselves always retain their wb.label and wb.name as generated during their creation.

See Also

Other waveband constructors: waveband()

Examples

```
split_bands(c(400,500,600))
split_bands(list(c(400,500),c(550,650)))
split_bands(list(A=c(400,500),B=c(550,650)))
split_bands(c(400,500,600), short.names=FALSE)
split_bands(c(400,500,600), list.names=c("a","b"))
split_bands(c(400,700), length.out=6)
split_bands(400:700, length.out=3)
split_bands(sun.spct, length.out=10)
split_bands(waveband(c(400,700)), length.out=5)
```

```
split_energy_irradiance
```

Energy irradiance for split spectrum regions

Description

This function returns the energy irradiance for a series of contiguous wavebands from a radiation-source spectrum. The returned values can be either absolute or relative to their sum.

Usage

```
split_energy_irradiance(
   w.length,
   s.irrad,
   cut.w.length = range(w.length),
   unit.in = "energy",
   scale = "absolute",
   check.spectrum = TRUE,
   use.cached.mult = FALSE,
   use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

Arguments

w.length	numeric vector of wavelengths (nm).
s.irrad	numeric vector of spectral (energy or photon) irradiance values (W m-2 nm-1) or (mol s-1 m-2 nm-1).
cut.w.length	numeric vector of wavelengths (nm).
unit.in	character string with allowed values "energy", and "photon", or its alias "quantum".
scale	character string indicating the scale used for the returned values ("absolute", "relative", "percent").
check.spectrum	logical indicating whether to sanity check input data, default is TRUE.

split_irradiance 351

use.cached.mult

logical Flag indicating whether multiplier values should be cached between

calls.

use.hinges

logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.

Value

a numeric vector of irradiances with no change in scale factor: [W m-2 nm-1] -> [W m-2] or [mol s-1 m-2] -> [W m-2] or relative values (fraction of one) if scale = "relative" or scale = "percent".

Note

The last three parameters control speed optimizations. The defaults should be suitable in most cases. If you set check_spectrum=FALSE then you should call check_spectrum at least once for your spectrum before using any of the other functions. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

See Also

Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

Examples

split_irradiance

Energy or photon irradiance for split spectrum regions

Description

This function returns the energy or photon irradiance for a series of contiguous wavebands from a radiation spectrum. The returned values can be either absolute or relative to their sum.

352 split_irradiance

Usage

```
split_irradiance(
   w.length,
   s.irrad,
   cut.w.length = range(w.length),
   unit.out = getOption("photobiology.base.unit", default = "energy"),
   unit.in = "energy",
   scale = "absolute",
   check.spectrum = TRUE,
   use.cached.mult = FALSE,
   use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

Arguments

numeric Vector of wavelengths [nm]. w.length numeric vector of spectral irradiances in $[W m^{-2} nm^{-1}]$ or $[mol s^{-1} sm^{-2} nm^{-1}]$ s.irrad as indicated by the argument pased to unit.in. cut.w.length numeric Vector of wavelengths [nm]. unit.out, unit.in character Allowed values "energy", and "photon", or its alias "quantum". a character A string indicating the scale used for the returned values ("absolute", scale "relative" or "percent"). check.spectrum logical Flag indicating whether to sanity check input data, default is TRUE. use.cached.mult logical Flag indicating whether multiplier values should be cached between calls. logical Flag indicating whether to insert "hinges" into the spectral data before use.hinges integration so as to reduce interpolation errors at the boundaries of the wavebands.

Value

A numeric vector of irradiances with no change in scale factor if scale == "absolute", $[W\,m^{-2}]$ or $[mol\,s^{-1}\,sm^{-2}]$ depending on the argument passed to unit.out or relative values (as fraction of one if scale == "relative" or percentages if scale == "percent" of photons or energy depending on the argument passed to unit.out.

Note

The last three parameters control speed optimizations. The defaults should be suitable in most cases. If you set check.spectrum=FALSE then you should call check_spectrum at least once for your spectrum before using any of the other functions. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

split_photon_irradiance 353

Examples

```
split_photon_irradiance
```

Photon irradiance for split spectrum regions

Description

This function returns the photon irradiance for a series of contiguous wavebands from a radiation spectrum. The returned values can be either absolute or relative to their sum.

Usage

```
split_photon_irradiance(
   w.length,
   s.irrad,
   cut.w.length = range(w.length),
   unit.in = "energy",
   scale = "absolute",
   check.spectrum = TRUE,
   use.cached.mult = FALSE,
   use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

Arguments

	w.length	numeric vector of wavelengths (nm).
	s.irrad	numeric vector of spectral (energy or photon) irradiance values (W m-2 nm-1).
	cut.w.length	numeric vector of wavelengths (nm).
	unit.in	character Allowed values "energy", and "photon", or its alias "quantum".
	scale	a character A string indicating the scale used for the returned values ("absolute", "relative", "percent").
	check.spectrum	logical Flag indicating whether to sanity check input data, default is TRUE.
use.cached.mult		
		logical Flag indicating whether multiplier values should be cached between calls.
	use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.

354 spread

Value

a numeric vector of photon irradiances with no change in scale factor: [W m-2 nm-1] -> [mol s-1 m-2], [mol s-1 m-2 nm-1] -> [mol s-1 m-2] or relative values (fraction of one based on photon units) if scale = "relative" or scale = "percent".

Note

The last three parameters control speed optimizations. The defaults should be suitable in most cases. If you set check.spectrum=FALSE then you should call check_spectrum at least once for your spectrum before using any of the other functions. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

```

Examples

spread

Expanse

Description

A method that returns the expanse (max(x) - min(x)) for R objects. In particular the wavelength [nm] expanse of the wavelength range of objects of classes waveband or of class generic_spct or derived (or the expanse of values in a numeric vector).

Usage

```
spread(x, ...)
wl_expanse(x, ...)
expanse(x, ...)
```

spread 355

```
## Default S3 method:
expanse(x, ...)

## S3 method for class 'numeric'
expanse(x, ...)

## S3 method for class 'waveband'
expanse(x, ...)

## S3 method for class 'generic_spct'
expanse(x, ...)

## S3 method for class 'generic_mspct'
expanse(x, ...)
```

Arguments

x an R object

... not used in current version

idx character Name of the column with the names of the members of the collection

of spectra.

Value

A numeric value equal to max(x) - min(x). In the case of spectral objects wavelength difference [nm]. For any other R object, according to available specialised methods of min and max.

Methods (by class)

- expanse(default): Default method for generic function
- expanse(numeric): Method for "numeric"
- expanse(waveband): Method for "waveband"
- expanse(generic_spct): Method for "generic_spct"
- expanse(generic_mspct): Method for "generic_mspct" objects.

Examples

```
expanse(10:20)
expanse(sun.spct)
wl_expanse(sun.spct)
expanse(sun.spct)
```

356 Subset

Subset	Subsetting spectra	
--------	--------------------	--

Description

Return subsets of spectra stored in class generic_spct or derived from it.

Usage

```
## S3 method for class 'generic_spct'
subset(x, subset, select, drop = FALSE, ...)
```

Arguments

x	object to be subsetted.
subset	logical expression indicating elements or rows to keep: missing values are taken as false.
select	expression, indicating columns to select from a spectrum.
drop	passed on to [indexing operator.
	further arguments to be passed to or from other methods.

Value

An object similar to x containing just the selected rows and columns. Depending on the columns remaining after subsetting the class of the object will be simplified to the most derived parent class.

Note

This method is copied from base::subset.data.frame() but ensures that all metadata stored in attributes of spectral objects are copied to the returned value.

Examples

```
subset(sun.spct, w.length > 400)
```

subset2mspct 357

subset2mspct

Convert 'long' or tidy spectral data into a collection of spectra

Description

Convert a data frame object or spectral object into a collection of spectra object of the matching class. For data frames converting numeric columns other than wavelength into individual spect objects. For collection of spectra objects, subset/expand long-form members into multiple members of the same collection.

Usage

```
subset2mspct(
    x,
    member.class = NULL,
    idx.var = NULL,
    drop.idx = TRUE,
    ncol = 1,
    byrow = FALSE,
    ...
)
```

Arguments

Value

A collection of spectral objects, each with attributes set if x is a spectral object in long form with metadata attributes. If this object was created by row binding with 'photobiology' 0.9.14 or later then all metadata for each individual spectrum will be preserved, except for unique comments which are merged.

Note

A non-null value for member. class is mandatory only when x is a data frame.

358 subt_spectra

See Also

```
Other Coercion methods for collections of spectra: as.calibration_mspct(), as.chroma_mspct(), as.cps_mspct(), as.filter_mspct(), as.generic_mspct(), as.object_mspct(), as.raw_mspct(), as.reflector_mspct(), as.response_mspct(), as.solute_mspct(), as.source_mspct(), split2mspct()
```

subt_spectra

Subtract two spectra

Description

The wavelength vectors of the two spectra are merged, and the missing spectral values are calculated by interpolation. After this, the two spectral values at each wavelength are added. This is 'parallel' operation between two spectra.

Usage

```
subt_spectra(
  w.length1,
  w.length2 = NULL,
  s.irrad1,
  s.irrad2,
  trim = "union",
  na.rm = FALSE
)
```

Arguments

```
w.length1     numeric vector of wavelength (nm).
w.length2     numeric vector of wavelength (nm).
s.irrad1     a numeric vector of spectral values.
s.irrad2     a numeric vector of spectral values.
trim     a character string with value "union" or "intersection".
na.rm     a logical value, if TRUE, not the default, NAs in the input are replaced with zeros.
```

Details

If trim=="union" spectral values are calculated for the whole range of wavelengths covered by at least one of the input spectra, and missing values are set in each input spectrum to zero before addition. If trim=="intersection" then the range of wavelengths covered by both input spectra is returned, and the non-overlapping regions discarded. If w.length2==NULL, it is assumed that both spectra are measured at the same wavelengths, and a simple addition is used, ensuring fast calculation.

summary.generic_spct 359

Value

a data frame with two numeric variables

w.length A numeric vector with the wavelengths (nm) obtained by "fusing" w.length1 and w.length2. w.length contains all the unique vales, sorted in ascending order.s.irrad A numeric vector with the sum of the two spectral values at each wavelength.

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), sum_spectra(), trim_tails(), v_insert_hinges(), v_replace_hinges()
```

Examples

```
head(sun.data)
zero.data <- with(sun.data, subt_spectra(w.length, w.length, s.e.irrad, s.e.irrad))
head(zero.data)
tail(zero.data)</pre>
```

summary.generic_spct Summary of one or more spectra

Description

Methods of generic function summary for objects of spectral classes and of classes for collections of spectra.

Usage

360 summary.generic_spct

```
idx = "spct.idx",
which.metadata = NULL,
expand = "none",
...
)
```

Arguments

object	An object of one of the spectral classes for which a summary is desired.
maxsum	integer Indicates how many levels should be shown for factors.
digits	integer Used for number formatting with format().
• • •	additional arguments affecting the summary produced, ignored in current version.
expand	character One of "none", "collection", "each" or "auto" indicating if multiple spectra in long form should be summarized as a collection or individually.
idx	character Name of the column with the names of the members of the collection of spectra.
which.metadata	character vector Names of attributes to retrieve, or "none" or "all". Obeyed if expand = FALSE, its default.

Details

Objects are summarized as is, ignoring the current settings of R options photobiology.radiation.unit and photobiology.filter.qty. Unlike R's summary, these methods can optionally summarize each spectrum stored in long form returning a list of summaries. Although this is frequently the most informative approach, the default remains similar to summary() method from R: to summarize object as a whole. Alternatively, multiple spectra stored in long form, can optionally be summarized also as a collection of spectra. Passing "auto" in the call, is equivalent to passing "each" or "collection" depending on the number of spectra contained in the object.

Value

A summary object matching the class of object, or a list of such objects or a summary object for a matching collection of spectra. Metadata stored in attributes are copied to identical attributes in the returned summary objects except when object is a collection of spectra or if expand = "collection" is passed in the call. In this two cases, a condensed summary is returned as a data frame and attributes from each member can be copied to variables in it.

Functions

• summary(generic_mspct):

Examples

```
summary(sun.spct)
class(summary(sun.spct))
summary(two_filters.spct)
class(summary(two_filters.spct))
summary(sun_evening.spct)
summary(two_filters.spct, expand = "none")
summary(two_filters.spct, expand = "each")
summary(two_filters.spct, expand = "collection")
summary(two_filters.spct, expand = "auto") # <= 4 spectra</pre>
summary(sun_evening.spct, expand = "auto") # > 4 spectra
where_measured(sun.spct)
where_measured(summary(sun.spct))
what_measured(summary(two_filters.spct))
what_measured(summary(two_filters.spct, expand = "each")[[1]])
summary(sun_evening.mspct)
summary(sun_evening.mspct, which.metadata = "when.measured")
summary(two_filters.mspct, which.metadata = "what.measured")
summary(two_filters.mspct, expand = "each")
```

summary_spct_classes Function that returns a vector containing the names of spectral summary classes.

Description

Function that returns a vector containing the names of spectral summary classes.

Usage

```
summary_spct_classes()
```

Value

A character vector of class names.

362 sum_spectra

sum_spectra

Add two spectra

Description

Merge wavelength vectors of two spectra, and compute the missing spectral values by interpolation within each spectrum. After this, the spectral values at each wavelength are added. This is a 'parallel' operation between two spectra.

Usage

```
sum_spectra(
  w.length1,
  w.length2 = NULL,
  s.irrad1,
  s.irrad2,
  trim = "union",
  na.rm = FALSE
)
```

Arguments

```
w.length1     numeric vector of wavelength (nm).
w.length2     numeric vector of wavelength (nm).
s.irrad1     a numeric vector of spectral values.
s.irrad2     a numeric vector of spectral values.
trim     a character string with value "union" or "intersection".
na.rm     a logical value, if TRUE, not the default, NAs in the input are replaced with zeros.
```

Details

If trim=="union" spectral values are calculated for the whole range of wavelengths covered by at least one of the input spectra, and missing values are set in each input spectrum to zero before addition. If trim=="intersection" then the range of wavelengths covered by both input spectra is returned, and the non-overlapping regions discarded. If w.length2 = NULL, it is assumed that both spectra are measured at the same wavelengths, and a simple addition is used, ensuring fast calculation.

Value

a data. frame with two numeric variables

w.length	A numeric vector with the wavelengths (nm) obtained by "fusing" w.length1 and w.length2. w.length contains all the unique vales, sorted in ascending order.
s.irrad	A numeric vector with the sum of the two spectral values at each wavelength.

tail(twice.sun.data)</pre>
```

sun.spct

Solar spectral irradiance (simulated)

Description

A dataset containing the wavelengths at a 1 nm interval and the corresponding spectral (energy) irradiance and spectral photon irradiance. Values simulated for 22 June 2010, near midday, at Helsinki, under partly cloudy conditions. The variables are as follows:

Usage

```
sun.spct
```

Format

A source_spct object and a data. frame, each with 511 rows and 3 variables An object of class data. frame with 508 rows and 3 columns.

Details

- w.length (nm), range 293 to 800 nm.
- s.e.irrad (W m-2 nm-1)
- s.q.irrad (mol m-2 nm-1)

Note

Package 'photobiologySun' contains data sets for the daylight spectrum under different conditions in and outside vegetation, stored in objects of these same classes, ready to be used with package 'photobiology'.

sun_daily.spct

Daily solar spectral irradiance (simulated)

Description

A dataset containing the wavelengths at a 1 nm interval and the corresponding spectral (energy) irradiance. Values simulated for 2 June 2012, at Helsinki, under clear sky conditions. The variables are as follows:

Usage

```
sun_daily.spct
sun_daily.data
sun.daily.spct
sun.daily.data
```

Format

A source_spct object and a data. frame, each with 511 rows and 3 variables

An object of class tbl_df (inherits from tbl, data.frame) with 511 rows and 3 columns.

An object of class source_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 522 rows and 3 columns.

An object of class tbl_df (inherits from tbl, data.frame) with 511 rows and 3 columns.

sun_daily.spct 365

Details

- w.length (nm), range 290 to 800 nm.
- s.e.irrad (J d-1 m-2 nm-1)
- s.q.irrad (mol d-1 m-2 nm-1)

Deprecation!

Objects sun.daily.spct and sun.daily.data have been renamed into sun_daily.spct and sun_daily.data, for consistency with other data sets in the package. Please, use the new names for new code.

Note

The simulations are based on libRadTran using hourly mean global radiation measurements to estimate cloud cover. The simulations were for each hour and the results integrated for the whole day.

```

366 sun_evening.spct

sun_evening.spct

Time series of solar spectral irradiance (measured)

Description

Two data objects containing containing the same time series of five spectra. Values measured in Viikki, Helsinki, under nearly clear sky in a summer evening.

Usage

```
sun_evening.spct
sun_evening.mspct
```

Format

A source_spct object and a source_mspct object.

An object of class source_mspct (inherits from generic_mspct, list) with 5 rows and 1 columns.

Details

The variables are as follows:

- w.length (nm), range 290 to 1000 nm.
- s.e.irrad (J d-1 m-2 nm-1)
- s.q.irrad (mol d-1 m-2 nm-1)

s_e_irrad2rgb

Description

Calculates rgb values from spectra based on human color matching functions (CMF) or chromaticity coordinates (CC). A CMF takes into account luminous sensitivity, while a CC only the color hue. This function, in contrast to that in package pavo does not normalize the values to equal luminosity, so using a CMF as input gives the expected result. Another difference is that it allows the user to choose the chromaticity data to be used. The data used by default is different, and it corresponds to the whole range of CIE standard, rather than the reduced range 400 nm to 700 nm. The wavelength limits are not hard coded, so the function could be used to simulate vision in other organisms as long as pseudo CMF or CC data are available for the simulation.

Usage

```
s_e_irrad2rgb(
  w.length,
  s.e.irrad,
  sens = photobiology::ciexyzCMF2.spct,
  color.name = NULL,
  check = TRUE
)
```

Arguments

w.length numeric vector of wavelengths (nm).
 s.e.irrad numeric vector of spectral irradiance values.
 sens a chroma_spct object with variables w.length, x, y, and z, giving the CC or CMF definition (default is the proposed human CMF according to CIE 2006.).
 color.name character string for naming the rgb color definition.
 check logical indicating whether to check or not spectral data.

Value

A color defined using rgb. The numeric values of the RGB components can be obtained using function col2rgb.

Note

Very heavily modified from Chad Eliason's <me16@zips.uakron.edu> spec2rgb function in package Pavo.

```

s_mean

Mean from collection of spectra

Description

Method to compute the "parallel" mean of values across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

```
s_mean(x, trim, na.rm, ...)
## Default S3 method:
s_mean(x, trim = 0, na.rm = FALSE, ...)
## S3 method for class 'generic_spct'
s_mean(x, trim = 0, na.rm = FALSE, ...)
## S3 method for class 'source_mspct'
s_mean(x, trim = 0, na.rm = FALSE, ...)
## S3 method for class 'response_mspct'
s_mean(x, trim = 0, na.rm = FALSE, ...)
```

s_mean 369

```
## S3 method for class 'filter_mspct'
s_mean(x, trim = 0, na.rm = FALSE, ...)
## S3 method for class 'reflector_mspct'
s_mean(x, trim = 0, na.rm = FALSE, ...)
## S3 method for class 'calibration_mspct'
s_mean(x, trim = 0, na.rm = FALSE, ...)
## S3 method for class 'cps_mspct'
s_mean(x, trim = 0, na.rm = FALSE, ...)
## S3 method for class 'raw_mspct'
s_mean(x, trim = 0, na.rm = FALSE, ...)
```

Arguments

X	An R object.
trim	numeric The fraction (0 to 0.5) of observations to be trimmed from each end of x before the mean is computed. Values of trim outside that range are taken as the nearest endpoint.
na.rm	logical A value indicating whether NA values should be stripped before the computation proceeds.
	Further arguments passed to or from other methods.

Details

Method specializations compute the mean at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiolgy'. Trimming of extreme values is possible (trimmed mean) and omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled.

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
s_mean(default):
s_mean(generic_spct):
s_mean(source_mspct):
s_mean(response_mspct):
s_mean(filter_mspct):
s_mean(reflector_mspct):
```

s_mean_se

- s_mean(calibration_mspct):
- s_mean(cps_mspct):
- s_mean(raw_mspct):

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

See Also

See mean for the mean() method used for the computations.

Examples

```
s_mean(sun_evening.mspct)
```

s_mean_se

Mean and standard error from collection of spectra

Description

Method to compute the "parallel" mean and the SEM. The spectral values are summarised across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

```
s_mean_se(x, na.rm, mult, ...)

## Default S3 method:
s_mean_se(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'generic_spct'
s_mean_se(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'filter_mspct'
s_mean_se(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'source_mspct'
s_mean_se(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'response_mspct'
s_mean_se(x, na.rm = FALSE, mult = 1, ...)
```

s_mean_se 371

```
## S3 method for class 'reflector_mspct'
s_mean_se(x, na.rm = FALSE, mult = 1, ...)
## S3 method for class 'calibration_mspct'
s_mean_se(x, na.rm = FALSE, mult = 1, ...)
## S3 method for class 'cps_mspct'
s_mean_se(x, na.rm = FALSE, mult = 1, ...)
## S3 method for class 'raw_mspct'
s_mean_se(x, na.rm = FALSE, mult = 1, ...)
```

Arguments

X	An R object Currently this package defines methods for collections of spectral objects.
na.rm	logical A value indicating whether NA values should be stripped before the computation proceeds.
mult	numeric number of multiples of standard error.
	Further arguments passed to or from other methods.

Details

Method specializations compute the mean and SEM at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled. The value passed as argument to 'mult'

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
s_mean_se(default):
s_mean_se(generic_spct):
s_mean_se(filter_mspct):
s_mean_se(source_mspct):
s_mean_se(response_mspct):
s_mean_se(reflector_mspct):
s_mean_se(calibration_mspct):
s_mean_se(cps_mspct):
s_mean_se(rew_mspct):
```

s_mean_se_band

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

See Also

See mean for the mean() method to compute the mean and se for the method used to compute the standard error of the mean.

Examples

```
s_mean_se(sun_evening.mspct)
```

s_mean_se_band

Mean plus and minus standard error from collection of spectra

Description

Method to compute the "parallel" mean and limits based on SEM. The spectral values are summarised across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

```
s_mean_se_band(x, na.rm, mult, ...)

## Default S3 method:
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'generic_spct'
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'filter_mspct'
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'source_mspct'
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'response_mspct'
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)

## S3 method for class 'reflector_mspct'
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)
```

s_mean_se_band 373

```
## S3 method for class 'calibration_mspct'
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)
## S3 method for class 'cps_mspct'
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)
## S3 method for class 'raw_mspct'
s_mean_se_band(x, na.rm = FALSE, mult = 1, ...)
```

Arguments

x An R object.

na.rm logical A value indicating whether NA values should be stripped before the computation proceeds.

mult numeric number of multiples of standard error.

... Further arguments passed to or from other methods.

Details

Method specializations compute the mean and limits based on SEM at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled. The value passed as argument to 'mult' can be used to estimate a confidence interval for each mean value.

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
s_mean_se_band(default):
s_mean_se_band(generic_spct):
s_mean_se_band(filter_mspct):
s_mean_se_band(source_mspct):
s_mean_se_band(response_mspct):
s_mean_se_band(reflector_mspct):
s_mean_se_band(calibration_mspct):
s_mean_se_band(cps_mspct):
s_mean_se_band(raw_mspct):
```

374 s_median

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

See Also

See mean for the mean() method used for the computations.

Examples

```
s_mean_se_band(sun_evening.mspct)
```

s_median

Median of a collection of spectra

Description

Method to compute the "parallel" median of values across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

```
s_median(x, na.rm, ...)

## Default S3 method:
s_median(x, na.rm = FALSE, ...)

## S3 method for class 'generic_spct'
s_median(x, na.rm = FALSE, ...)

## S3 method for class 'source_mspct'
s_median(x, na.rm = FALSE, ...)

## S3 method for class 'response_mspct'
s_median(x, na.rm = FALSE, ...)

## S3 method for class 'filter_mspct'
s_median(x, na.rm = FALSE, ...)

## S3 method for class 'reflector_mspct'
s_median(x, na.rm = FALSE, ...)

## S3 method for class 'calibration_mspct'
s_median(x, na.rm = FALSE, ...)
```

s_median 375

```
## S3 method for class 'cps_mspct'
s_median(x, na.rm = FALSE, ...)
## S3 method for class 'raw_mspct'
s_median(x, na.rm = FALSE, ...)
```

Arguments

An R object. Currently this package defines methods for collections of spectral objects.na.rm logical. A value indicating whether NA values should be stripped before the

computation proceeds.

Further arguments passed to or from other methods.

Details

Method specializations compute the median at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled.

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

- s_median(default):
- s_median(generic_spct):
- s_median(source_mspct):
- s_median(response_mspct):
- s_median(filter_mspct):
- s_median(reflector_mspct):
- s_median(calibration_mspct):
- s_median(cps_mspct):
- s_median(raw_mspct):

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

376 s_prod

See Also

See median for the median() method used for the computations.

Examples

```
s_median(sun_evening.mspct)
```

s_prod

Product from collection of spectra

Description

Method to compute the "parallel" product of values across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

```
s_prod(x, na.rm, ...)
## Default S3 method:
s_prod(x, na.rm = FALSE, ...)
## S3 method for class 'generic_spct'
s_prod(x, na.rm = FALSE, ...)
## S3 method for class 'source_mspct'
s_prod(x, na.rm = FALSE, ...)
## S3 method for class 'response_mspct'
s_prod(x, na.rm = FALSE, ...)
## S3 method for class 'filter_mspct'
s_prod(x, na.rm = FALSE, ...)
## S3 method for class 'reflector_mspct'
s_prod(x, na.rm = FALSE, ...)
## S3 method for class 'calibration_mspct'
s_prod(x, na.rm = FALSE, ...)
## S3 method for class 'cps_mspct'
s_prod(x, na.rm = FALSE, ...)
## S3 method for class 'raw_mspct'
s_prod(x, na.rm = FALSE, ...)
```

s_prod 377

Arguments

X	An R object. Currently this package defines methods for collections of spectral objects.
na.rm	logical. A value indicating whether NA values should be stripped before the computation proceeds.
	Further arguments passed to or from other methods.

Details

Method specializations compute the product at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled.

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
s_prod(default):
s_prod(generic_spct):
s_prod(source_mspct):
s_prod(response_mspct):
s_prod(filter_mspct):
s_prod(reflector_mspct):
s_prod(calibration_mspct):
s_prod(cps_mspct):
s_prod(raw_mspct):
```

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

The product operation is meaningful only for certain physical quantities or bases of expression.

See Also

See prod for the prod() method used for the computations.

378 s_range

Examples

```
s_prod(two_filters.mspct)
```

s_range

Range of a collection of spectra

Description

Method to compute the "parallel" range of values across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

Usage

```
s_range(x, na.rm, ...)
## Default S3 method:
s_range(x, na.rm = FALSE, ...)
## S3 method for class 'generic_spct'
s_range(x, na.rm = FALSE, ...)
## S3 method for class 'filter_mspct'
s_range(x, na.rm = FALSE, ...)
## S3 method for class 'source_mspct'
s_range(x, na.rm = FALSE, ...)
## S3 method for class 'response_mspct'
s_range(x, na.rm = FALSE, ...)
## S3 method for class 'reflector_mspct'
s_range(x, na.rm = FALSE, ...)
## S3 method for class 'calibration_mspct'
s_range(x, na.rm = FALSE, ...)
## S3 method for class 'cps_mspct'
s_range(x, na.rm = FALSE, ...)
## S3 method for class 'raw_mspct'
s_range(x, na.rm = FALSE, ...)
```

Arguments

x An R object. Currently this package defines methods for collections of spectral objects.

s_range 379

na.rm logical. A value indicating whether NA values should be stripped before the computation proceeds.

... Further arguments passed to or from other methods.

Details

Method specializations compute the range at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled.

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
s_range(default):
s_range(generic_spct):
s_range(filter_mspct):
s_range(source_mspct):
s_range(response_mspct):
s_range(reflector_mspct):
s_range(calibration_mspct):
s_range(cps_mspct):
s_range(raw_mspct):
```

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

```
s_range(sun_evening.mspct)
```

380 s_sd

 s_sd

Standard Deviation of a collection of spectra

Description

Method to compute the "parallel" standard deviation of values across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

Usage

```
s_sd(x, na.rm, ...)
## Default S3 method:
s_sd(x, na.rm = FALSE, ...)
## S3 method for class 'generic_spct'
s_sd(x, na.rm = FALSE, ...)
## S3 method for class 'filter_mspct'
s_sd(x, na.rm = FALSE, ...)
## S3 method for class 'source_mspct'
s_sd(x, na.rm = FALSE, ...)
## S3 method for class 'response_mspct'
s_sd(x, na.rm = FALSE, ...)
## S3 method for class 'reflector_mspct'
s_sd(x, na.rm = FALSE, ...)
## S3 method for class 'calibration_mspct'
s_sd(x, na.rm = FALSE, ...)
## S3 method for class 'cps_mspct'
s_sd(x, na.rm = FALSE, ...)
## S3 method for class 'raw_mspct'
s_sd(x, na.rm = FALSE, ...)
```

Arguments

X	An R object. Currently this package defines methods for collections of spectral
	objects.

na.rm logical. A value indicating whether NA values should be stripped before the computation proceeds.

. . . Further arguments passed to or from other methods.

s_sd 381

Details

Method specializations compute the standard deviation at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled.

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
• s_sd(default):
```

- s_sd(generic_spct):
- s_sd(filter_mspct):
- s_sd(source_mspct):
- s_sd(response_mspct):
- s_sd(reflector_mspct):
- s_sd(calibration_mspct):
- s_sd(cps_mspct):
- s_sd(raw_mspct):

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

See Also

See sd for details about sd() methods for other classes.

Examples

```
s_sd(sun_evening.mspct)
```

382 s_se

s_se Standard Error of a collection of spectra

Description

Method to compute the "parallel" standard error of the mean across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

Usage

```
s_s(x, na.rm, ...)
## Default S3 method:
s_se(x, na.rm = FALSE, ...)
## S3 method for class 'generic_spct'
s_se(x, na.rm = FALSE, ...)
## S3 method for class 'source_mspct'
s_se(x, na.rm = FALSE, ...)
## S3 method for class 'response_mspct'
s_se(x, na.rm = FALSE, ...)
## S3 method for class 'filter_mspct'
s_se(x, na.rm = FALSE, ...)
## S3 method for class 'reflector_mspct'
s_se(x, na.rm = FALSE, ...)
## S3 method for class 'calibration_mspct'
s_se(x, na.rm = FALSE, ...)
## S3 method for class 'cps_mspct'
s_s(x, na.rm = FALSE, ...)
## S3 method for class 'raw_mspct'
s_se(x, na.rm = FALSE, ...)
```

Arguments

X	An R object. Currently this package defines methods for collections of spectral
	objects.

na.rm logical. A value indicating whether NA values should be stripped before the computation proceeds.

. . . Further arguments passed to or from other methods.

s_sum 383

Details

Method specializations compute the standard error of the mean at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled.

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
s_se(default):
s_se(generic_spct):
s_se(source_mspct):
s_se(response_mspct):
s_se(filter_mspct):
s_se(reflector_mspct):
s_se(calibration_mspct):
s_se(cps_mspct):
s_se(raw_mspct):
```

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

Examples

```
s_se(sun_evening.mspct)
```

 s_sum

Sum from collection of spectra

Description

Method to compute the "parallel" sum of values across members of a collection of spectra or of a spectral object containing multiple spectra in long form.

384 s_sum

Usage

```
s_sum(x, na.rm, ...)
## Default S3 method:
s_sum(x, na.rm = FALSE, ...)
## S3 method for class 'generic_spct'
s_sum(x, na.rm = FALSE, ...)
## S3 method for class 'filter_mspct'
s_sum(x, na.rm = FALSE, ...)
## S3 method for class 'source_mspct'
s_sum(x, na.rm = FALSE, ...)
## S3 method for class 'response_mspct'
s_sum(x, na.rm = FALSE, ...)
## S3 method for class 'reflector_mspct'
s_sum(x, na.rm = FALSE, ...)
## S3 method for class 'calibration_mspct'
s_sum(x, na.rm = FALSE, ...)
## S3 method for class 'cps_mspct'
s_sum(x, na.rm = FALSE, ...)
## S3 method for class 'raw_mspct'
s_sum(x, na.rm = FALSE, ...)
```

Arguments

x An R object.
 na.rm logical A value indicating whether NA values should be stripped before the computation proceeds.
 ... Further arguments passed to or from other methods.

Details

Method specializations compute the sum at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled.

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary

s_var 385

spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
s_sum(default):
s_sum(generic_spct):
s_sum(filter_mspct):
s_sum(source_mspct):
s_sum(response_mspct):
s_sum(reflector_mspct):
s_sum(calibration_mspct):
s_sum(cps_mspct):
s_sum(rew_mspct):
```

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

The sum operation is meaningful only for certain physical quantities or bases of expression.

See Also

See sum for the sum() method used for the computations.

Examples

```
s_sum(sun_evening.mspct)
```

s_var

Variance of a collection of spectra

Description

Method to compute the "parallel" variance of values across members of a collections of spectra or of a spectral object containing multiple spectra in long form.

386 s_var

Usage

```
s_{var}(x, na.rm, ...)
## Default S3 method:
s_var(x, na.rm = FALSE, ...)
## S3 method for class 'generic_spct'
s_var(x, na.rm = FALSE, ...)
## S3 method for class 'filter_mspct'
s_var(x, na.rm = FALSE, ...)
## S3 method for class 'source_mspct'
s_var(x, na.rm = FALSE, ...)
## S3 method for class 'response_mspct'
s_var(x, na.rm = FALSE, ...)
## S3 method for class 'reflector_mspct'
s_var(x, na.rm = FALSE, ...)
## S3 method for class 'calibration_mspct'
s_var(x, na.rm = FALSE, ...)
## S3 method for class 'cps_mspct'
s_var(x, na.rm = FALSE, ...)
## S3 method for class 'raw_mspct'
s_{var}(x, na.rm = FALSE, ...)
```

Arguments

X	An R object. Currently this package defines methods for collections of spectral objects.
na.rm	logical. A value indicating whether NA values should be stripped before the computation proceeds.
	Further arguments passed to or from other methods.

Details

Method specializations compute the variance at each wavelength across a group of spectra stored in an object of one of the classes defined in package 'photobiology'. Omission of NAs is done separately at each wavelength. Interpolation is not applied, so all spectra in x must share the same set of wavelengths. An error is triggered if this condition is nor fulfilled.

T2A 387

Value

If x is a collection spectral of objects, such as a "filter_mspct" object, the returned object is of same class as the members of the collection, such as "filter_spct", containing the summary spectrum, with variables with names tagged for summaries other than mean or median.

Methods (by class)

```
s_var(default):
s_var(generic_spct):
s_var(filter_mspct):
s_var(source_mspct):
s_var(response_mspct):
s_var(reflector_mspct):
s_var(calibration_mspct):
s_var(cps_mspct):
s_var(raw_mspct):
```

Note

Objects of classes raw_spct and cps_spct can contain data from multiple scans in multiple variables or "columns". The methods accept as arguments objects of these classes only if spectra contain data for a single spectrometer scan. In the case of cps_spct objects, a single column can also contain data from multiple scans spliced into a single variable.

See cor for details about var(), which is used for the computations.

Examples

```
s_var(sun_evening.mspct)
```

T2A

Convert transmittance into absorbance.

Description

Function that converts transmittance (fraction) into \log_{10} -based absorbance (a.u.).

388 T2A

Usage

```
T2A(x, action, byref, clean, ...)
## Default S3 method:
T2A(x, action = NULL, byref = FALSE, ...)
## S3 method for class 'numeric'
T2A(x, action = NULL, byref = FALSE, clean = TRUE, ...)
## S3 method for class 'filter_spct'
T2A(x, action = "add", byref = FALSE, clean = TRUE, strict.A = FALSE, ...)
## S3 method for class 'filter_mspct'
T2A(
 х,
 action = "add",
 byref = FALSE,
 clean = TRUE,
 strict.A = TRUE,
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

x	an R object.
action	character Allowed values "replace" and "add".
byref	logical indicating if new object will be created by reference or by copy of x.
clean	logical replace off-boundary values before conversion
	not used in current version
strict.A	logical Attempt to compute a true internal absorbance even if "total" transmittance is stored in x.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

Absorbance, A, is frequently used in chemistry as it is linearly related to the concentration of a solute dissolved in a solvent.

T2A 389

where, A absorbance and τ is internal transmittance. By default, if total transmittance, T, is stored in x, the returned value computed as

$$A = -\log_{10} T$$

is not strictly absorbance. In this case and in cases when the measured light attenuation is the result of scattering, or when part of measured light is re-emitted after absorption the use of *attenuance* is the IUPAC-recommended name for this quantity.

If strict. A = TRUE is passed in the call and total transmittance, T, and total reflectance, ρ , are both available, absorbance is computed as:

$$A = -\log_{10}(T - \rho)/(1 - \rho)$$

where ρ can be either spectral total reflectance stored in x as data or a single approximate Rfr. constant value stored as part of the metadata.

Value

A copy of x with a column A added and other columns possibly deleted except for w.length. If action = "replace", in all cases, the additional columns are removed, even if no column needs to be added.

Methods (by class)

- T2A(default): Default method for generic function
- T2A(numeric): Method for numeric vectors
- T2A(filter_spct): Method for filter spectra
- T2A(filter_mspct): Method for collections of filter spectra

Note

The default A. strict = FALSE ensures indentical behaviour as in 'photobiology' (<= 0.11.0).

390 T2Afr

T2Afr

Convert transmittance into absorptance.

Description

Function that converts transmittance (fraction) into absorptance (fraction). If reflectance (fraction) is available, it also allows conversions between internal and total absorptance.

```
T2Afr(x, action, byref, clean, ...)
## Default S3 method:
T2Afr(x, action = NULL, byref = FALSE, clean = FALSE, ...)
## S3 method for class 'numeric'
T2Afr(x, action = NULL, byref = FALSE, clean = FALSE, Rfr = NA_real_, ...)
## S3 method for class 'filter_spct'
T2Afr(x, action = "add", byref = FALSE, clean = FALSE, ...)
## S3 method for class 'object_spct'
T2Afr(x, action = "add", byref = FALSE, clean = FALSE, ...)
## S3 method for class 'filter_mspct'
T2Afr(
  х,
  action = "add",
  byref = FALSE,
  clean = FALSE,
  . . . ,
  .parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'object_mspct'
T2Afr(
  х,
  action = "add",
  byref = FALSE,
  clean = FALSE,
  .parallel = FALSE,
  .paropts = NULL
)
```

T2Afr 391

Arguments

x an R object.

action character Allowed values "replace" and "add".

byref logical indicating if new object will be created by reference or by copy of x.

clean logical replace off-boundary values before conversion.

... not used in current version.

Rfr numeric vector. Spectral reflectance o reflectance factor. Set to zero if x is

internal reflectance,

. parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

Absorptance, internal transmittance and total reflectance when expressed as fractions, add up to one:

$$1 = \alpha + \tau + \rho$$

where, α is absorptance, τ is internal transmittance and ρ is total reflectance. If any two of these quantities are known, the third one can be computed from them.

On the other hand:

$$1 = \alpha \prime + T$$

where, $\alpha t = \alpha + \rho$, measured together. In this case, there is not enough information available to compute α .

Thus, method T2Afr() computes either α or $\alpha\prime$, depending on whether τ or T are contained in the argument passed to x, but neither of them when only τ is known. To know which quantity has been computed, use getTfrType() to query whether the computations were based on τ or T.

The R names used are: If r for τ and T are If r, Af r for α and $\alpha\prime$, and Rf r for rho. The distinction between τ and T and between α and $\alpha\prime$ is made based on metadata attributes.

Value

A copy of x with a column Afr added and other columns possibly deleted except for w.length. If action = "replace", in all cases, the redundant columns are removed, even when column Afr was present in the argument passed to x.

392 tag

Methods (by class)

```

tag

Tag a spectrum

Description

Spectra are tagged by adding variables and attributes containing color definitions, labels, and a factor following the wavebands given in w. band. This methods are most useful for plotting realistic computed colors from spectral data.

```
tag(x, ...)
## Default S3 method:
tag(x, ...)
## S3 method for class 'generic_spct'
tag(
    x,
    w.band = NULL,
    wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
    use.hinges = TRUE,
    short.names = TRUE,
    chroma.type = "CMF",
    byref = FALSE,
    ...
)
```

393

```
## S3 method for class 'generic_mspct'
tag(
    x,
    w.band = NULL,
    wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
    use.hinges = TRUE,
    short.names = TRUE,
    chroma.type = "CMF",
    byref = FALSE,
    ...,
    .parallel = FALSE,
    .paropts = NULL
)
```

Arguments

X	an R object.
	ignored (possibly used by derived methods).
w.band	waveband or list of waveband objects. The waveband(s) determine the region(s) of the spectrum that are tagged
wb.trim	logical Flag telling if wavebands crossing spectral data boundaries are trimmed or ignored
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
short.names	logical Flag indicating whether to use short or long names for wavebands
chroma.type	character telling whether "CMF", "CC", or "both" should be returned for human vision, or an object of class chroma_spct for any other trichromic visual system.
byref	logical Flag indicating if new object will be created by reference or by copy of x
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A copy of x expanded with additional columns with color-related information.

Methods (by class)

- tag(default): Default method for generic
- tag(generic_spct): Tag one of generic_spct, and derived classes including source_spct, filter_spct, reflector_spct, object_spct, and response_spct.
- tag(generic_mspct): Tag one of generic_mspct, and derived classes including source_mspct, filter_mspct, reflector_mspct, object_mspct, and response_mspct.

Tfr_fraction

Note

NULL as w. band argument does not add any new tags, instead it removes existing tags if present. NA, the default, as w. band argument removes existing waveband tags if present and sets the wl.color variable. If a waveband object or a list of wavebands is supplied as argument then tagging is based on them, and wl.color is also set.

See Also

```
Other tagging and related functions: is_tagged(), untag(), wb2rect_spct(), wb2spct(), wb2tagged_spct()
```

Examples

```
tag(sun.spct)
tag(sun.spct, list(A = waveband(c(300,3005))))
```

Tfr_fraction

transmittance:transmittance fraction

Description

This function returns the transmittance fraction for a given pair of wavebands of a filter spectrum.

```
Tfr_fraction(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
 wb.trim,
  use.cached.mult,
  use.hinges,
)
## Default S3 method:
Tfr_fraction(
  spct,
 w.band.num,
 w.band.denom,
  scale.factor,
 wb.trim,
  use.cached.mult,
  use.hinges,
)
```

Tfr_fraction 395

```
## S3 method for class 'filter_spct'
Tfr_fraction(
  spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "mean",
  naming = "short",
  name.tag = NULL,
)
## S3 method for class 'filter_mspct'
Tfr_fraction(
  spct,
 w.band.num = NULL,
 w.band.denom = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "mean",
  naming = "short",
  name.tag = NULL,
  attr2tb = NULL,
  idx = "spct.idx"
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct an object of class "filter_spct".

w.band.num waveband object or a list of waveband objects used to compute the numerator(s) and denominator(s) of the fraction(s).

w.band.denom waveband object or a list of waveband objects used to compute the denominator(s) of the fraction(s).

scale.factor numeric vector of length 1, or length equal to that of w.band. Numeric multiplier applied to returned values.

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded use.cached.mult

logical indicating whether multiplier values should be cached between calls

396 Tfr_fraction

use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wave-
	bands.
	other arguments (possibly ignored)
quantity	character One of "total", "average" or "mean".
naming	character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
name.tag	character Used to tag the name of the returned values.
attr2tb	character vector, see <pre>add_attr2tb</pre> for the syntax for attr2tb passed as is to formal parameter <pre>col.names</pre> .
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "mean" or quantity = "average" the ratio is based on two **mean spectral transmittance**, one computed for each waveband.

$$\frac{\overline{\operatorname{Tfr}_{\lambda}}(s,wb_{\text{num}})}{\overline{\operatorname{Tfr}_{\lambda}}(s,wb_{\text{denom}}) + \overline{\operatorname{Tfr}_{\lambda}}(s,wb_{\text{num}})}$$

If the argument is set to quantity = "total" the fraction is based on two **integrated transmittance**, one computed for each waveband.

$$\frac{\operatorname{Tfr}(s, wb_{\text{num}})}{\operatorname{Tfr}(s, wb_{\text{denom}}) + \operatorname{Tfr}(s, wb_{\text{num}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[Tfr:Tfr]" is appended if quantity = "total" and "[Tfr(wl):Tfr(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

Methods (by class)

- Tfr_fraction(default): Default for generic function
- Tfr_fraction(filter_spct): Method for filter_spct objects
- Tfr_fraction(filter_mspct): Calculates Tfr:Tfr from a filter_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

See Also

Other transmittance ratio functions: Tfr_normdiff(), Tfr_ratio()

Examples

Tfr_normdiff

transmittance:transmittance normalised difference

Description

This function returns the transmittance normalized difference index for a given pair of wavebands of a filter spectrum.

```
Tfr_normdiff(
   spct,
   w.band.plus,
   w.band.minus,
   scale.factor,
```

```
wb.trim,
  use.cached.mult,
  use.hinges,
)
## Default S3 method:
Tfr_normdiff(
  spct,
 w.band.plus,
 w.band.minus,
  scale.factor,
 wb.trim,
  use.cached.mult,
  use.hinges,
)
## S3 method for class 'filter_spct'
Tfr_normdiff(
  spct,
 w.band.plus = NULL,
 w.band.minus = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "mean",
  naming = "short",
  name.tag = NULL,
  . . .
)
## S3 method for class 'filter_mspct'
Tfr_normdiff(
  spct,
 w.band.plus = NULL,
 w.band.minus = NULL,
  scale.factor = 1,
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.cached.mult = FALSE,
  use.hinges = NULL,
  quantity = "mean",
  naming = "short",
  name.tag = NULL,
  attr2tb = NULL,
  idx = "spct.idx",
```

```
.parallel = FALSE,
.paropts = NULL
)
```

Arguments

spct an object of class "filter_spct".

w.band.plus, w.band.minus

waveband object(s) or a list(s) of waveband objects used to compute the additive

and subtractive transmittance terms of the normalized difference index.

scale.factor numeric vector of length 1, or length equal to that of w. band. Numeric multiplier

applied to returned values.

wb.trim logical if TRUE wavebands crossing spectral data boundaries are trimmed, if

FALSE, they are discarded

use.cached.mult

logical indicating whether multiplier values should be cached between calls

use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

... other arguments (possibly ignored)

quantity character One of "total", "average" or "mean".

naming character one of "long", "default", "short" or "none". Used to select the type of

names to assign to returned value.

name.tag character Used to tag the name of the returned values.

attr2tb character vector, see add_attr2tb for the syntax for attr2tb passed as is to

formal parameter col.names.

idx character Name of the column with the names of the members of the collection

of spectra.

. parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "mean" or quantity = "average" the ratio is based on two **mean spectral photon transmittances**, one computed for each waveband.

$$\frac{\overline{\operatorname{Tfr}_{\lambda}}(s, wb_{\operatorname{plus}}) - \overline{\operatorname{Tfr}_{\lambda}}(s, wb_{\operatorname{minus}})}{\overline{\operatorname{Tfr}_{\lambda}}(s, wb_{\operatorname{plus}}) + \overline{\operatorname{Tfr}_{\lambda}}(s, wb_{\operatorname{minus}})}$$

If the argument is set to quantity = "total" the fraction is based on two **photon transmittances**, one computed for each waveband.

$$\frac{\operatorname{Tfr}(s, wb_{\text{plus}}) - \operatorname{Tfr}(s, wb_{\text{minus}})}{\operatorname{Tfr}(s, wb_{\text{plus}}) + \operatorname{Tfr}(s, wb_{\text{minus}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[Tfr:Tfr]" is appended if quantity = "total" and "[Tfr(wl):Tfr(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

Methods (by class)

- Tfr_normdiff(default): Default for generic function
- Tfr_normdiff(filter_spct): Method for filter_spct objects
- Tfr_normdiff(filter_mspct): Calculates Tfr:Tfr from a filter_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult =T RUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

attr2tb	character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names.
idx	character Name of the column with the names of the members of the collection of spectra.
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Details

With the default quantity = "mean" or quantity = "average" the ratio is based on two **mean spectral transmittance**, one computed for each waveband.

$$\frac{\overline{\mathrm{Tfr}_{\lambda}}(s, wb_{\mathrm{num}})}{\overline{\mathrm{Tfr}_{\lambda}}(s, wb_{\mathrm{denom}}))}$$

If the argument is set to quantity = "total" the ratio is based on two **integrated transmittance**, one computed for each waveband.

$$\frac{\mathrm{Tfr}(s, wb_{\mathrm{num}})}{\mathrm{Tfr}(s, wb_{\mathrm{denom}})}$$

Only if the wavelength expanse of the two wavebands is the same, these two ratios are numerically identical.

Value

In the case of methods for individual spectra, a numeric vector with name attribute set. The name is based on the name of the wavebands unless a named list of wavebands is supplied in which case the names of the list elements are used. "[Tfr:Tfr]" is appended if quantity = "total" and "[Tfr(wl):Tfr(wl)]" if quantity = "mean" or quantity = "average".

A data. frame is returned in the case of collections of spectra, containing one column for each fraction definition, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

Fraction definitions are "assembled" from the arguments passed to w. band. num and w. band. denom. If both arguments are lists of waveband definitions, with an equal number of members, then the wavebands are paired to obtain as many fractions as the number of wavebands in each list. Recycling for wavebands takes place when the number of denominator and numerator wavebands differ.

Methods (by class)

- Tfr_ratio(default): Default for generic function
- Tfr_ratio(filter_spct): Method for filter_spct objects
- Tfr_ratio(filter_mspct): Calculates Tfr:Tfr from a filter_mspct object.

Note

The last two parameters control speed optimizations. The defaults should be suitable in most cases. If you will use repeatedly the same SWFs on many spectra measured at exactly the same wavelengths you may obtain some speed up by setting use.cached.mult=TRUE. However, be aware that you are responsible for ensuring that the wavelengths are the same in each call, as the only test done is for the length of the w.length vector.

thin_wl(x, ...)
## S3 method for class 'calibration_mspct'
thin_wl(x, ...)
```

Arguments

x An R object

... additional named arguments passed down to f.

max.wl.step numeric. Largest allowed wavelength difference between adjacent spectral val-

ues in nanometres (nm).

max.slope.delta

numeric in 0 to 1. Largest allowed change in relative slope of the spectral quantity nor no between edicant raise of values

tity per nm between adjacent pairs of values.

span integer A peak (or valley) is defined as an element in a sequence which is greater

(or smaller) than all other elements within a window of width span centred at

that element. Use NULL for the global peak.

col.names	character. Name of the column of x containing the spectral data to check against max.slope.delta. Currently only one column supported.
unit.out	character Allowed values "energy", and "photon", or its alias "quantum".
gty.out	character Allowed values "transmittance", and "absorbance".

Details

The algorithm used for spectra is "naive" in an effort to keep it efficient. It works by iteratively attempting to delete every other observation along wavelengths, based on the criteria for maximum wavelength step and maximum relative step in the spectral variable between adjacent data values.

Value

An object of the same class as x but with a reduced density of wavelength values in those regions were slope is shallow and featureless.

Methods (by class)

```
• thin_wl(default): Default for generic function
```

```
• thin_wl(generic_spct):
```

```
• thin_wl(source_spct):
```

• thin_wl(response_spct):

• thin_wl(filter_spct):

• thin_wl(reflector_spct):

• thin_wl(solute_spct):

• thin_wl(raw_spct):

• thin_wl(cps_spct):

• thin_wl(object_spct):

• thin_wl(chroma_spct):

• thin_wl(calibration_spct):

• thin_wl(generic_mspct):

• thin_wl(chroma_mspct):

• thin_wl(calibration_mspct):

Note

The value of max.slope.delta is expressed as relative change in the slope of spectral variable per nanometre. This means that values between 0.0005 and 0.005 tend to work reasonably well. The best value will depend on the wavelength step of the input and noise in data. A moderate smoothing before thinning can sometimes help in the case of noisy data.

The amount of thinning is almost always less than the value of criteria passed as argument as it is based on existing wavelength values. For example if we start with a spectrum with a uniform wavelength step of 1 nm, possible steps in the thinned spectrum are 2, 4, 8, 16, 32, etc. nm. The algorithm, does work with any step sizes, regular or variable in the input. Thinning is most effective

408 times-.generic_spct

for spectra with large "featureless" regions as the algorithm attempts not to discard information, contrary to smoothing or interpolation.

Local peaks and valleys are always preserved, using by default a span of 21 to search for them. See find_peaks.

```

transmittance 409

transmittance

Transmittance

Description

Summary transmittance for supplied wavebands from filter or object spectrum.

```
transmittance(spct, w.band, quantity, wb.trim, use.hinges, ...)
## Default S3 method:
transmittance(spct, w.band, quantity, wb.trim, use.hinges, ...)
## S3 method for class 'filter_spct'
transmittance(
  spct,
 w.band = NULL,
  quantity = "average",
 wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
)
## S3 method for class 'object_spct'
transmittance(
  spct,
 w.band = NULL,
  quantity = "average",
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = NULL,
  naming = "default",
)
## S3 method for class 'filter_mspct'
transmittance(
  spct,
  w.band = NULL,
  quantity = "average",
  wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
  use.hinges = getOption("photobiology.use.hinges", default = NULL),
  naming = "default",
  attr2tb = NULL,
  idx = "spct.idx"
```

410 transmittance

```
## S3 method for class 'object_mspct'
transmittance(
   spct,
   w.band = NULL,
   quantity = "average",
   wb.trim = getOption("photobiology.waveband.trim", default = TRUE),
   use.hinges = getOption("photobiology.use.hinges", default = NULL),
   naming = "default",
   ...,
   attr2tb = NULL,
   idx = "spct.idx",
   .parallel = FALSE,
   .paropts = NULL
)
```

Arguments

an R object.
waveband or list of waveband objects or a numeric vector of length two. The waveband(s) determine the region(s) of the spectrum that are summarized. If a numeric range is supplied a waveband object is constructed on the fly from it.
character string One of "average" or "mean", "total", "contribution", "contribution.pc", "relative" or "relative.pc".
logical if TRUE wavebands crossing spectral data boundaries are trimmed, if FALSE, they are discarded.
logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
ignored (possibly used by derived methods).
character one of "long", "default", "short" or "none". Used to select the type of names to assign to returned value.
character vector, see add_attr2tb for the syntax for attr2tb passed as is to formal parameter col.names.
character Name of the column with the names of the members of the collection of spectra.
if TRUE, apply function in parallel, using parallel backend provided by foreach
a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.

Value

A named numeric vector in the case of methods for individual spectra, with one value for each waveband passed to parameter w.band. A data.frame in the case of collections of spectra, con-

Trig 411

taining one column for each waveband object, an index column with the names of the spectra, and optionally additional columns with metadata values retrieved from the attributes of the member spectra.

By default values are only integrated, but depending on the argument passed to parameter quantity they can be re-expressed as relative fractions or percentages. In the case of vector output, names attribute is set to the name of the corresponding waveband unless a named list is supplied in which case the names of the list members are used.

Methods (by class)

- transmittance(default): Default method
- transmittance(filter_spct): Method for filter spectra
- transmittance(object_spct): Method for object spectra
- transmittance(filter_mspct): Calculates transmittance from a filter_mspct
- transmittance(object_mspct): Calculates transmittance from a object_mspct

Note

The use.hinges parameter controls speed optimization. The defaults should be suitable in most cases. Only the range of wavelengths in the wavebands is used and all BSWFs are ignored.

Examples

```
transmittance(polyester.spct, waveband(c(280, 315))) transmittance(polyester.spct, waveband(c(315, 400))) transmittance(polyester.spct, waveband(c(400, 700)))
```

Trig

Trigonometric Functions

Description

Trigonometric functions for object of generic_spct and derived classes. \ The functions are applied to the spectral data, not the wavelengths. The quantity in the spectrum to which the function is applied depends on the class of x and the current value of output options.

```
## $3 method for class 'generic_spct'
cos(x)
## $3 method for class 'generic_spct'
sin(x)
## $3 method for class 'generic_spct'
```

412 trimInstrDesc

```
tan(x)
## S3 method for class 'generic_spct'
acos(x)
## S3 method for class 'generic_spct'
asin(x)
## S3 method for class 'generic_spct'
atan(x)
```

Arguments

Χ

an object of class "generic_spct" or a derived class.

trimInstrDesc

Trim the "instr.desc" attribute

Description

Function to trim the "instr.desc" attribute of an existing generic_spct object, discarding all fields except for 'spectrometer.name', 'spectrometer.sn', 'bench.grating', 'bench.slit', and calibration name.

Usage

```
trimInstrDesc(
    x,
    fields = c("time", "spectrometer.name", "spectrometer.sn", "bench.grating",
        "bench.slit", "entrance.optics")
)
```

Arguments

x a generic_spct object

fields

a character vector with the names of the fields to keep, or if first member is "-", the names of fields to delete; "*" as first member of the vector makes the function a no-op, leaving the spectrum object unaltered.

Value

X

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a generic_spct object, x is not modified.

trimInstrSettings 413

See Also

Other measurement metadata functions: add_attr2tb(), getFilterProperties(), getHowMeasured(), getInstrDesc(), getInstrSettings(), getSoluteProperties(), getWhatMeasured(), getWhenMeasured(), getWhereMeasured(), get_attributes(), isValidInstrDesc(), isValidInstrSettings(), select_spct_attributes setFilterProperties(), setHowMeasured(), setInstrDesc(), setInstrSettings(), setSoluteProperties(), setWhatMeasured(), setWhereMeasured(), spct_attr2tb(), spct_metadata(), subset_attributes(), trimInstrSettings()

trimInstrSettings

Trim the "instr.settings" attribute

Description

Function to trim the "instr.settings" attribute of an existing generic_spct object, by discarding some fields.

Usage

```
trimInstrSettings(x, fields = "*")
```

Arguments

x a generic_spct object

fields a character vector with the names of the fields to keep, or if first member is

"-"', the names of fields to delete; "*" as first member of the vector makes the

function a no-op, leaving the spectrum object unaltered.

Value

X

Note

This function alters x itself by reference and in addition returns x invisibly. If x is not a generic_spct object, x is not modified.

See Also

```

```

414 trim_spct

trim_spct

Trim (or expand) head and/or tail of a spectrum

Description

Trim head and tail of a spectrum based on wavelength limits, interpolating the values at the boundaries of the range. Trimming is needed for example to remove short wavelength noise when the measured spectrum extends beyond the known emission spectrum of the measured light source. Occasionally one may want also to expand the wavelength range.

```
trim_spct(
  spct,
  range = NULL,
  low.limit = NULL,
 high.limit = NULL,
 use.hinges = TRUE,
  fill = NULL,
 byref = FALSE,
  verbose = getOption("photobiology.verbose")
)
trim_mspct(
 mspct,
  range = NULL,
  low.limit = NULL,
 high.limit = NULL,
  use.hinges = TRUE,
  fill = NULL,
  byref = FALSE,
  verbose = getOption("photobiology.verbose"),
  .parallel = FALSE,
  .paropts = NULL
)
trim2overlap(
  mspct,
  use.hinges = TRUE,
  verbose = getOption("photobiology.verbose"),
  .parallel = FALSE,
  .paropts = NULL
)
extend2extremes(
 mspct,
  use.hinges = TRUE,
```

trim_spct 415

```
fill = NA,
  verbose = getOption("photobiology.verbose"),
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

spct an object of class "generic_spct".

range a numeric vector of length two, or any other object for which method range()

will return a numeric vector of length two.

low.limit shortest wavelength to be kept (defaults to shortest w.length value).

high.limit longest wavelength to be kept (defaults to longest w.length value).

use.hinges logical Flag indicating whether to insert "hinges" into the spectral data before

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

fill if fill==NULL then tails are deleted, otherwise tails or s.irrad are filled with the

value of fill.

byref logical indicating if new object will be created by reference or by copy of spct.

verbose logical.

mspct an object of class "generic_mspct"

.parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Value

a spectrum object or a collection of spectral objects of the same class as x with wavelength heads and tails clipped or extended.

Note

When expanding a spectrum, if fill==NULL, then expansion is not performed. Range can be "waveband" object, a numeric vector or a list of numeric vectors, or any other user-defined or built-in object for which range() returns a numeric vector of length two, that can be interpreted as wavelengths expressed in nm.

See Also

```
Other trim functions: clip_wl(), trim_waveband(), trim_wl()
```

416 trim_tails

Examples

```
trim_spct(sun.spct, low.limit=300)
trim_spct(sun.spct, low.limit=300, fill=NULL)
trim_spct(sun.spct, low.limit=300, fill=NA)
trim_spct(sun.spct, low.limit=300, fill=0.0)
trim_spct(sun.spct, range = c(300, 400))
trim_spct(sun.spct, range = c(300, NA))
trim_spct(sun.spct, range = c(NA, 400))
```

trim_tails

Trim (or expand) head and/or tail

Description

Trim tails of a spectrum based on wavelength limits, interpolating the values at the boundaries. Trimming is needed for example to remove short wavelength noise when the measured spectrum extends beyond the known emission spectrum of the measured light source. Occasionally one may want also to expand the wavelength range.

Usage

```
trim_tails(
    x,
    y,
    low.limit = min(x),
    high.limit = max(x),
    use.hinges = TRUE,
    fill = NULL,
    verbose = TRUE
)
```

Arguments

X	numeric vector of wavelengths.
у	numeric vector of values for a spectral quantity.
low.limit	smallest x-value to be kept (defaults to smallest x-value in input).
high.limit	largest x-value to be kept (defaults to largest x-value in input).
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
fill	if $fill == NULL$ then tails are deleted, otherwise tails of y are filled with the value of fill.
verbose	logical Use to suppress warnings.

trim_waveband 417

Value

A data.frame with variables x and y.

Note

When expanding a spectrum, if fill == NULL, expansion is not performed with a warning.

See Also

```

```

Examples

trim_waveband

Trim (or expand) head and/or tail

Description

Trimming of waveband boundaries can be needed when the spectral data do not cover the whole waveband, or wavebands may have to be removed altogether.

```
trim_waveband(
   w.band,
   range = NULL,
   low.limit = 0,
   high.limit = Inf,
   trim = getOption("photobiology.waveband.trim", default = TRUE),
   use.hinges = TRUE,
   trunc.labels = getOption("photobiology.brief.trunc.names", default = c("]", "["))
)
```

418 trim_waveband

Arguments

w.band an object of class "waveband" or a list of such objects. range a numeric vector of length two, or any other object for which function range() will return a numeric vector of two wavelengths (nm). low.limit shortest wavelength to be kept (defaults to 0 nm). high.limit longest wavelength to be kept (defaults to Inf nm). trim logical (default is TRUE which trims the wavebands at the boundary, while FALSE discards wavebands that are partly off-boundary). logical Flag indicating whether to insert "hinges" into the spectral data before use.hinges integration so as to reduce interpolation errors at the boundaries of the wavebands. trunc.labels character vector of length one or two. The first string will be prepended to the waveband name and label on left truncation and the second appended on right truncation. If the vector is of length one, the same string will be used in both cases.

Details

This function will accept both individual wavebands or list of wavebands. When the input is a list, wavebands outside the range of the range will be removed from the list, and those partly outside the target range either "trimmed" to this edge truncated if trim = TRUE is passed or excluded if trim = FALSE). Waveband objects contain a name and a label that are used to label the returned values of calculations that make use of them. When a waveband object is truncated so that the definition changes, the name and label are also modified so that the change is visible when they are used. The name and label have a string prepended or appended, and what strings are used can be set with an R option.

Value

The returned value is a waveband object or a list of waveband objects depending on whether a single waveband object or a list of waveband objects was supplied as argument to formal parameter w.band. If no waveband is retained, in the first case, a NULL waveband object is returned, and in the second case, a list of length zero is returned. If the input is a named, list, names are preserved in the returned list.

Note

Modification of the name and label stored in the wavebands passed as input is done so that summaries produced with the modified objects can be recognized as different from those computed using the original definitions when the waveband objects are used. When the input is a named list, the names of the retained members of the list are not modified as these are not part of the definitions.

See Also

Other trim functions: clip_wl(), trim_spct(), trim_wl()

trim_wl 419

Examples

```
VIS <- waveband(c(380, 760)) # manometers

trim_waveband(VIS, c(400,700))

trim_waveband(VIS, low.limit = 400)

trim_waveband(VIS, high.limit = 700)

trim_waveband(VIS, c(400,700), trunc.labels = c(">", "<"))

trim_waveband(VIS, c(400,700), trunc.labels = "!")
```

trim_wl

Trim head and/or tail of a spectrum

Description

Trim head and tail of a spectrum based on wavelength limits, with interpolation at range boundaries used by default. Expansion is also possible.

```
trim_wl(x, range, use.hinges, fill, ...)
## Default S3 method:
trim_wl(x, range, use.hinges, fill, ...)
## S3 method for class 'generic_spct'
trim_wl(x, range = NULL, use.hinges = TRUE, fill = NULL, ...)
## S3 method for class 'generic_mspct'
trim_wl(
 х,
  range = NULL,
  use.hinges = TRUE,
  fill = NULL,
  . . . ,
  .parallel = FALSE,
  .paropts = NULL
)
## S3 method for class 'waveband'
trim_wl(
 Х,
  range = NULL,
 use.hinges = TRUE,
 fill = NULL,
  trim = getOption("photobiology.waveband.trim", default = TRUE),
```

420 trim_wl

```
## S3 method for class 'list'
trim_wl(
    x,
    range = NULL,
    use.hinges = TRUE,
    fill = NULL,
    trim = getOption("photobiology.waveband.trim", default = TRUE),
    ...
)
```

Arguments

х	an R object.
range	a numeric vector of length two, or any other object for which function range() will return two.
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
fill	if fill == NULL then tails are deleted, otherwise tails are filled with the value of fill.
	ignored (possibly used by derived methods).
.parallel	if TRUE, apply function in parallel, using parallel backend provided by foreach
.paropts	a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so that all cluster nodes have the correct environment set up for computing.
trim	logical (default is TRUE which trims the wavebands at the boundary, while FALSE discards wavebands that are partly off-boundary).

Value

A copy of x, usually trimmed or expanded to a different length, either shorter or longer. Possibly with some of the original spectral data values replaced with fill.

Methods (by class)

- trim_wl(default): Default for generic function
- trim_wl(generic_spct): Trim an object of class "generic_spct" or derived.
- trim_wl(generic_mspct): Trim an object of class "generic_mspct" or derived.
- trim_wl(waveband): Trim an object of class "waveband".
- trim_wl(list): Trim a list (of "waveband" objects).

two_filters.spct 421

Note

By default the w.length values for the first and last rows in the returned object are the values supplied as range.

trim_wl when applied to waveband objects always inserts hinges when trimming.

trim_wl when applied to waveband objects always inserts hinges when trimming.

Examples

```
trim_wl(sun.spct, range = c(400, 500))
trim_wl(sun.spct, range = c(NA, 500))
trim_wl(sun.spct, range = c(400, NA))
```

two_filters.spct

Transmittance spectrum of plastic films

Description

Datasets containing the wavelengths at a 1 nm interval and fractional total transmittance for a clear polyester film and a yellow theatrical "gel".

Usage

```
two_filters.spct
two_filters.mspct
polyester.spct
yellow_gel.spct
```

Format

A filter_spct object with 611 rows and 2 variables. Individually as filter_spct objects, and together as a collection stored in a filter_mspct object and in a long-form filter_spct object.

An object of class filter_mspct (inherits from generic_mspct, list) with 2 rows and 1 columns.

An object of class filter_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 561 rows and 2 columns.

An object of class filter_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 611 rows and 2 columns.

422 two_sensors.mspct

Details

- w.length (nm).
- Tfr (0..1).
- spct.idx (names, only in two_filters.spct).

Note

Package 'photobiologyFilters' contains data sets for hundreds of optical filters and materials in objects of these same classes, ready to be used with package 'photobiology'.

yellow_gel.spct
summary(two_filters.mspct)
```

two_sensors.mspct

Spectral response of two light sensors.

Description

A dataset containing a collection of two spectra.

Usage

```
two_sensors.mspct
two_sensors.spct
```

Format

A response_spct object with 186 rows and 2 variables

An object of class response_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 280 rows and 4 columns.

Details

The spectra in photodiode.spct and ccd.spct stored as a collection in a response_mspct object named response.mspct with members photodiode and ccd, and and in long form in a link{response_spct} object named response.mspct identified bit the levels of factor spct.idx.

uncollect2spct 423

```

Examples

```
two_sensors.mspct
two_sensors.spct
```

uncollect2spct

Extract all members from a collection

Description

Extract all members from a collection into separate objects in the parent frame of the call.

Usage

```
uncollect2spct(x, ...)
## Default S3 method:
uncollect2spct(x, ...)
## S3 method for class 'generic_mspct'
uncollect2spct(
    x,
    name.tag = ".spct",
    ignore.case = FALSE,
    check.names = TRUE,
    check.overwrite = TRUE,
    ...
)
```

Arguments

X	An R object
	additional named arguments passed down to f.
name.tag	character. A string used as tag for the names of the objects. If of length zero, names of members are used as named of objects. Otherwise the tag is appended, unless already present in the member name.
ignore.case	logical. If FALSE, the pattern matching used for name.tag is case sensitive and if TRUE, case is ignored during matching.

424 untag

check.names

logical. If TRUE then the names of the objects created are checked to ensure that they are syntactically valid variable names and unique. If necessary they are adjusted (by make.names) so that they are, and if FALSE names are used as is.

check.overwrite

logical. If TRUE trigger an error if an exisitng object would be overwritten, and if FALSE silently overwrite objects.

Value

Utility used for its side effects, invisibly returns a character vector with the names of the objects created.

Methods (by class)

- uncollect2spct(default): Default for generic function
- uncollect2spct(generic_mspct):

See Also

Other experimental utility functions: collect2mspct(), drop_user_cols(), thin_wl()

Examples

```
my.mscpt <- source_mspct(list(sun1.spct = sun.spct, sun2.spct = sun.spct))
uncollect2spct(my.mscpt)
ls(pattern = "*.spct")</pre>
```

untag

Remove tags

Description

Remove tags from an R object if present, otherwise return the object unchanged.

```
untag(x, ...)
## Default S3 method:
untag(x, ...)
## S3 method for class 'generic_spct'
untag(x, byref = FALSE, ...)
## S3 method for class 'generic_mspct'
untag(x, byref = FALSE, ...)
```

upgrade_spct 425

Arguments

x an R object.

... ignored (possibly used by derived methods).

byref logical indicating if new object will be created by reference or by copy of x

Value

if x contains tag data they are removed and the "spct.tags" attribute is set to NA, while if x has no tags, it is not modified. In either case, the byref argument is respected: in all cases if byref = FALSE a copy of x is returned.

Methods (by class)

- untag(default): Default for generic function
- untag(generic_spct): Specialization for generic_spct
- untag(generic_mspct): Specialization for generic_spct

See Also

Other tagging and related functions: is_tagged(), tag(), wb2rect_spct(), wb2spct(), wb2tagged_spct()

upgrade_spct

Upgrade one spectral object

Description

Update the spectral class names of objects to those used in photobiology (>= 0.6.0) and add 'version' attribute as used in photobiology (>= 0.70).

Usage

```
upgrade_spct(object)
```

Arguments

object

generic.spct A single object to upgrade

Value

The modified object (invisibly).

Note

The object is modified by reference. The class names with ending ".spct" replaced by their new equivalents ending in "_spct".

426 using_Tfr

See Also

Other upgrade from earlier versions: is.old_spct(), upgrade_spectra()

upgrade_spectra

Upgrade one or more spectral objects

Description

Update the spectral class names of objects to those used in photobiology (>= 0.6.0).

Usage

```
upgrade_spectra(obj.names = ls(parent.frame()))
```

Arguments

obj.names

char Names of objects to upgrade as a vector of character strings

Value

The modified object (invisibly).

Note

The objects are modified by reference. The class names with ending ".spct" are replaced by their new equivalents ending in "_spct". object.names can safely include names of any R object. Names of objects which do not belong to any the old .spct classes are ignored. This makes it possible to supply as argument the output from 1s, the default, or its equivalent objects.

See Also

Other upgrade from earlier versions: is.old_spct(), upgrade_spct()

using_Tfr

Use photobiology options

Description

Execute an R expression, possibly compound, using a certain setting for spectral data related options.

Usage

```
using_Tfr(expr)
using_Afr(expr)
using_A(expr)
using_energy(expr)
using_photon(expr)
using_quantum(expr)
```

Arguments

expr

an R expression to execute.

Value

The value returned by the execution of expression.

References

Based on withOptions() as offered by Thomas Lumley, and listed in https://www.burns-stat.com/the-options-mechanism-in-r/, section Deep End, of "The Options mechanism in R" by Patrick Burns.

valleys

Valleys or local minima

Description

Function that returns a subset of an R object with observations corresponding to local maxima.

```
valleys(x, span, ignore_threshold, strict, ...)
## Default S3 method:
valleys(x, span = NA, ignore_threshold = NA, strict = NA, na.rm = FALSE, ...)

  na.rm = FALSE,
  var.name = "counts",
  refine.wl = FALSE,
 method = "spline",
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

x an R object

span

integer A valley is defined as an element in a sequence which is smaller than all other elements within a window of width span centered at that element. Use

valleys 433

NULL for the global peak.

ignore_threshold

numeric Value between 0.0 and 1.0 indicating the relative size compared to tallest peak threshold below which peaks will be ignored. Negative values set a threshold so that the tallest peaks are ignored, instead of the shortest.

strict logical If TRUE, an element must be strictly greater than all other values in its

window to be considered a peak.

... ignored

na.rm logical indicating whether NA values should be stripped before searching for

peaks.

var.name, x.var.name, y.var.name

character Name of column where to look for valleys.

refine.wl logical Flag indicating if valley location should be refined by fitting a function.

method character String with the name of a method. Currently only spline interpolation

is implemented.

unit.out character One of "energy" or "photon"

filter.qty character One of "transmittance" or "absorbance"

. parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

. paropts a list of additional options passed into the foreach function when parallel compu-

tation is enabled. This is important if (for example) your code relies on external data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Value

A subset of x with rows corresponding to local minima.

Methods (by class)

- valleys(default): Default function usable on numeric vectors.
- valleys(default): Default returning always NA.
- valleys(numeric): Default function usable on numeric vectors.
- valleys(data.frame): Method for "data.frame" objects.
- valleys(generic_spct): Method for "generic_spct" objects.
- valleys(source_spct): Method for "source_spct" objects.
- valleys(response_spct): Method for "response_spct" objects.
- valleys(filter_spct): Method for "filter_spct" objects.
- valleys(reflector_spct): Method for "reflector_spct".
- valleys(solute_spct): Method for "solute_spct" objects.
- valleys(cps_spct): Method for "cps_spct" objects.
- valleys(raw_spct): Method for "raw_spct" objects.
- valleys(generic_mspct): Method for "generic_mspct" objects.

verbose_as_default

- valleys(source_mspct): Method for "source_mspct" objects.
- valleys(response_mspct): Method for "cps_mspct" objects.
- valleys(filter_mspct): Method for "filter_mspct" objects.
- valleys(reflector_mspct): Method for "reflector_mspct" objects.
- valleys(solute_mspct): Method for "solute_mspct" objects.
- valleys(cps_mspct): Method for "cps_mspct" objects.
- valleys(raw_mspct): Method for "raw_mspct" objects.

See Also

```
Other peaks and valleys functions: find_peaks(), find_spikes(), get_peaks(), peaks(), replace_bad_pixs(), spikes(), wls_at_target()
```

Examples

```
valleys(sun.spct, span = 50)
valleys(sun.spct)
```

verbose_as_default

Set error reporting options

Description

Set error reporting related options easily.

Usage

```
verbose_as_default(flag = TRUE)
strict_range_as_default(flag = TRUE)
```

Arguments

flag

logical.

Value

Previous value of the modified option.

v_insert_hinges 435

v_insert_hinges

Insert spectral data values at new wavelength values.

Description

Inserting wavelengths values immediately before and after a discontinuity in the SWF, greatly reduces the errors caused by interpolating the weighted irradiance during integration of the effective spectral irradiance. This is specially true when data have a relatively large wavelength step size and/or when the weighting function used has discontinuities in its value or slope. This function differs from insert_hinges() in that it returns a vector of y values instead of a tibble.

Usage

```
v_insert_hinges(x, y, h)
```

Arguments

- x numeric vector (sorted in increasing order).
- y numeric vector.
- h a numeric vector giving the wavelengths at which the y values should be inserted by interpolation, no interpolation is indicated by an empty numeric vector (numeric(0)).

Value

A numeric vector with the numeric values of y, but longer. Unless the hinge values were already present in y, each inserted hinge, expands the vector by two values.

See Also

```
Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_replace_hinges()
```

v_replace_hinges

Overwrite spectral data values at existing wavelength values.

Description

Overwriting spectral data with interpolated values at wavelengths values containing bad data is needed when cleaning spectral data. This function differs from insert_hinges() in that it returns a vector of y values instead of a tibble.

436 water.spct

Usage

```
v_replace_hinges(x, y, h)
```

Arguments

x numeric vector (sorted in increasing order).

y numeric vector.

h a numeric vector giving the wavelengths at which the y values should be replaced by interpolation, no interpolation is indicated by an empty numeric vector

(numeric(0)).

Value

A numeric vector with the numeric values of y with values at the hinges replaced by interpolation of neighbours.

See Also

Other low-level functions operating on numeric vectors.: as_energy(), as_quantum_mol(), calc_multipliers(), div_spectra(), energy_irradiance(), energy_ratio(), insert_hinges(), integrate_xy(), interpolate_spectrum(), irradiance(), l_insert_hinges(), oper_spectra(), photon_irradiance(), photon_ratio(), photons_energy_ratio(), prod_spectra(), s_e_irrad2rgb(), split_energy_irradiance(), split_photon_irradiance(), subt_spectra(), sum_spectra(), trim_tails(), v_insert_hinges()

water.spct

Molar spectral attenuation coefficient of water

Description

A dataset containing the wavelengths at a 2 nm interval and the corresponding attenuation coefficients.

Usage

```
water.spct
```

Format

A solute_spct object with 251 rows and 2 variables

Details

- w.length (nm), range 300 to 800 nm.
- K.mole (cm-1/M)

waveband

Waveband constructor method

Description

Constructor for "waveband" objects that can be used as input when calculating irradiances.

Usage

```
waveband(
  x = NULL,
  weight = NULL,
  SWF.e.fun = NULL,
  SWF.q.fun = NULL,
  norm = NULL,
  SWF.norm = NULL,
  hinges = NULL,
  wb.name = NULL,
  wb.label = wb.name
)

new_waveband(
  w.low,
```

438 waveband

```
w.high,
weight = NULL,
SWF.e.fun = NULL,
SWF.q.fun = NULL,
norm = NULL,
SWF.norm = NULL,
hinges = NULL,
wb.name = NULL,
wb.label = wb.name)
```

Arguments

x any R object on which applying the method range() yields an vector of two

numeric values, describing a range of wavelengths [nm].

weight a character string "SWF" or "BSWF", use NULL (the default) to indicate no weight-

ing used when calculating irradiance.

SWF.e.fun, SWF.q.fun

a functions giving multipliers for a spectral weighting function (energy and

quantum, respectively) as a function of wavelength [nm].

norm a single numeric value indicating the wavelength [nm] at which the SWF should

be normalized to 1.0; NULL is interpreted as no normalization.

SWF. norm a numeric value giving the native normalization wavelength [nm] used by SWF. e. fun

and SWF.q.fun.

hinges a numeric vector giving the wavelengths at which values in s.irrad should be

inserted by interpolation before integration is attempted. No interpolation is indicated by an empty vector (numeric(0)), while interpolation at both bound-

aries of the band is indicated by NULL.

wb.name character string giving the name for the waveband defined, default is NULL for

an automatically generated name.

wb.label character string giving the label of the waveband to be used for labelling com-

puted summaries or plots, default is wb. name. (This is usually a shorter character

string than wb.name.)

w.low, w.high numeric value, wavelengths at the short end and long ends of the wavelength

band [nm].

Details

Objects of class waveband are used to store the different bits of information needed to compute summaries from spectral data by integration over wavelengths. The wavelength ranges, possible spectral weighting functions (SWF) or biological spectral weighting functions (BSWF), their normalization wavelengths and names and labels used for reporting the results are all stored in waveband objects. This facilitates the use of functions that compute summaries, as well as ensures consistency in computations and labelling, as all the bits of information are passed together. Class "waveband" is derived from R class list.

waveband_ratio 439

Value

a waveband object

Functions

• new_waveband(): A less flexible variant

See Also

Other waveband constructors: split_bands()

Examples

```
waveband(c(400,700))
new_waveband(400,700)
```

waveband_ratio

Photon or energy ratio

Description

This function gives the (energy or photon) irradiance ratio between two given wavebands of a radiation spectrum.

Usage

```
waveband_ratio(
  w.length,
  s.irrad,
  w.band.num = NULL,
  w.band.denom = NULL,
  unit.out.num = NULL,
  unit.out.denom = unit.out.num,
  unit.in = "energy",
  check.spectrum = TRUE,
  use.cached.mult = FALSE,
  use.hinges = getOption("photobiology.use.hinges", default = NULL)
)
```

Arguments

```
w.length numeric Vector of wavelengths [nm].

s.irrad numeric vector of spectral irradiances in [W\ m^{-2}\ nm^{-1}] or [mol\ s^{-1}\ sm^{-2}\ nm^{-1}] as indicated by the argument pased to unit.in.
```

440 waveband_ratio

```
w.band.num, w.band.denom
```

waveband objects used to compute the numerator and denominator of the ratio.

unit.out.num, unit.out.denom

character Base of expression used to compute the numerator and denominator of the ratio. Allowed values "energy", and "photon", or its alias "quantum".

character Allowed values "energy", and "photon", or its alias "quantum". unit.in

check.spectrum logical Flag indicating whether to sanity check input data, default is TRUE.

use.cached.mult

logical Flag indicating whether multiplier values should be cached between

calls.

logical Flag indicating whether to insert "hinges" into the spectral data before use.hinges

integration so as to reduce interpolation errors at the boundaries of the wave-

bands.

Value

a single numeric value giving the ratio

Note

The default for both w. band parameters is a waveband covering the whole range of w. length. From version 0.9.19 onwards use of this default does not trigger a warning, but instead is used silently.

Examples

```
# photon:photon ratio
with(sun.data,
     waveband_ratio(w.length, s.e.irrad,
                    new_waveband(400,500),
                    new_waveband(400,700), "photon"))
# energy:energy ratio
with(sun.data,
     waveband_ratio(w.length, s.e.irrad,
                    new waveband(400.500).
                    new_waveband(400,700), "energy"))
# energy:photon ratio
with(sun.data,
     waveband_ratio(w.length, s.e.irrad,
                    new_waveband(400,700),
                    new_waveband(400,700),
                    "energy", "photon"))
# photon:photon ratio waveband : whole spectrum
with(sun.data,
     waveband_ratio(w.length, s.e.irrad,
                    new_waveband(400,500),
                    unit.out.num="photon"))
# photon:photon ratio of whole spectrum should be equal to 1.0
with(sun.data,
     waveband_ratio(w.length, s.e.irrad,
     unit.out.num="photon"))
```

wb2rect_spct 441

wb2rect_spct (Create tagged spectrum from wavebands
----------------	---------------------------------------

Description

Create a generic_spct object with wavelengths from the range of wavebands in a list. The spectrum is suitable for plotting labels, symbols, rectangles or similar, as the midpoint of each waveband is added to the spectrum.

Usage

```
wb2rect_spct(w.band, short.names = TRUE, chroma.type = "CMF")
fast_wb2rect_spct(w.band, chroma.type = "CMF", simplify = TRUE)
```

Arguments

w.band	waveband or list of waveband objects The waveband(s) determine the wavelengths in variable w.length of the returned spectrum
short.names	logical Flag indicating whether to use short or long names for wavebands
chroma.type	character telling whether "CMF", "CC", or "both" should be returned for human vision, or an object of class chroma_spct for any other trichromic visual system.
simplify	logical Flag indicating whether to merge neighboring rectangles of equal color. Simplification is done only for narrow wavebands.

Value

A generic.spectrum object, with columns w.length, wl.low, wl.hi, wl.color, wb.color and wb.name. The w.length values are the midpoint of the wavebands, wl.low and wl.high give the boundaries of the wavebands, wl.color the color definition corresponding to the wavelength at the center of the waveband and wb.color the color of the waveband as a whole (assuming a flat energy irradiance spectrum). Different spectral data variables are set to zero and added making the returned value compatible with classes derived from generic_spct.

Note

Function fast_wb2rect_spct() differs from wb2rect_spct() in that it computes colors for narrow wavebands based on the midpoint wavelength and uses vectorization when possible. It always returns color definitions with short names, which are also used as waveband names for narrow wavebands and merged wavebands. The purpose of merging of rectangles is to speed up rendering and to reduce the size of vector graphics output. This function should be used with care as the color definitions returned are only approximate and original waveband names can be lost.

442 wb2tagged_spct

wb2spct

Create spectrum from wavebands

Description

Create a generic_spct object with wavelengths from wavebands in a list.

Usage

```
wb2spct(w.band)
```

Arguments

w.band

waveband or list of waveband objects The waveband(s) determine the wavelengths in variable w. length of the returned spectrum

Value

A generic spectrum object, with columns w.length set to the *union* of all boundaries and hinges defined in the waveband(s). Different spectral data variables are set to zero and added making the returned value compatible with classes derived from generic_spct.

See Also

Other tagging and related functions: is_tagged(), tag(), untag(), wb2rect_spct(), wb2tagged_spct()

wb2tagged_spct

Create tagged spectrum from wavebands

Description

Create a tagged generic_spct object with wavelengths from the range of wavebands in a list, and names of the same bands as factor levels, and corresponding color definitions. The spectrum is not suitable for plotting labels, symbols, rectangles or similar, as the midpoint of each waveband is not added to the spectrum.

Usage

```
wb2tagged_spct(
  w.band,
  use.hinges = TRUE,
  short.names = TRUE,
  chroma.type = "CMF",
  ...
)
```

wb_trim_as_default 443

Arguments

w.band	waveband or list of waveband objects The waveband(s) determine the $region(s)$ of the spectrum that are tagged and the wavelengths returned in variable w.length.
use.hinges	logical Flag indicating whether to insert "hinges" into the spectral data before integration so as to reduce interpolation errors at the boundaries of the wavebands.
short.names	logical Flag indicating whether to use short or long names for wavebands.
chroma.type	character telling whether "CMF", "CC", or "both" should be returned for human vision, or an object of class chroma_spct for any other trichromic visual system.
	ignored (possibly used by derived methods).

Value

A spectrum as returned by wb2spct but additionally tagged using function tag

See Also

Other tagging and related functions: is_tagged(), tag(), untag(), wb2rect_spct(), wb2spct()

Description

Set computation related options easily.

Usage

```
wb_trim_as_default(flag = TRUE)
use_cached_mult_as_default(flag = TRUE)
```

Arguments

flag logical.

Value

Previous value of the modified option.

```
white_led.source_spct White led bulb spectrum
```

Description

Datasets containing wavelengths and the corresponding spectral irradiance data for an Osram warm white led lamp, and the corresponding raw instrument counts and counts per second data underlying them.

Usage

```
white_led.source_spct
white_led.cps_spct
white_led.raw_spct
```

Format

A source_spct object with 1421 rows and 2 columns, a cps_spct object with 2068 rows and 2 columns, and a raw_spct object with 2068 rows and 4 columns.

An object of class cps_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 2068 rows and 2 columns.

An object of class raw_spct (inherits from generic_spct, tbl_df, tbl, data.frame) with 2068 rows and 4 columns.

Details

```
• w.length (nm), range 250 to 900 nm.
```

```
• s.e.irrad (W m-2 nm-1)
```

or

- w.length (nm), range 188 to 1117 nm.

wl2wavenumber

Wavelength conversions

Description

Convert wavelength (nm) into wave number, frequency (Hz) or energy per photon (J, or eV) and back.

Usage

```
wl2wavenumber(w.length, unit.exponent = 0)
wavenumber2wl(wavenumber, unit.exponent = 0)
wl2frequency(w.length, unit.exponent = 0)
frequency2wl(frequency, unit.exponent = 0)
wl2energy(w.length, unit.exponent = 0, unit = "joule")
energy2wl(photon.energy, unit.exponent = 0, unit = "joule")
```

Arguments

w.length numeric wavelength (nm)

unit.exponent integer Exponent of the scale multiplier implicit in result, e.g., use 3 for kJ.

wavenumber numeric Wave number in waves per metre, possibly with a scale factor according

to unit.exponent.

frequency numeric Frequency in Hz, possibly with the scale factor according to unit.exponent.

unit character One of "joule" or "eV".

photon.energy numeric Energy of one photon in joule or eV, possibly with a scale factor ac-

cording to unit.exponent.

Details

These functions always expect as input and return wavelengths expressed in nanometres (nm) as all other functions in the R for photobiology suite of packages. Conversions depend on Plank's constant, h, the speed of light in vacuum, c, and Avogadro's number, N_A . The values used for these constants have at least nine significant digits.

Examples

wls_at_target

Find wavelengths values corresponding to a target spectral value

Description

Find wavelength values corresponding to a target spectral value in a spectrum. The name of the column of the spectral data to be used is inferred from the class of x and the argument passed to unit.out or filter.qty or their defaults that depend on R options set.

Usage

```
wls_at_target(
    x,
    target = NULL,
    interpolate = FALSE,
    idfactor = length(target) > 1,
    na.rm = FALSE,
    ...
)

## Default S3 method:
wls_at_target(
    x,
    target = NULL,
    interpolate = FALSE,
    idfactor = length(target) > 1,
```

```
na.rm = FALSE,
)
## S3 method for class 'data.frame'
wls_at_target(
 Х,
  target = "0.5max",
  interpolate = FALSE,
 idfactor = length(target) > 1,
 na.rm = FALSE,
  x.var.name = NULL,
 y.var.name = NULL,
)
## S3 method for class 'generic_spct'
wls_at_target(
 Х,
  target = "0.5max",
  interpolate = FALSE,
 idfactor = length(target) > 1,
 na.rm = FALSE,
  col.name = NULL,
 y.var.name = col.name,
)
## S3 method for class 'source_spct'
wls_at_target(
 Χ,
  target = "0.5max",
  interpolate = FALSE,
  idfactor = length(target) > 1,
  na.rm = FALSE,
  unit.out = getOption("photobiology.radiation.unit", default = "energy"),
)
## S3 method for class 'response_spct'
wls_at_target(
 х,
  target = "0.5max",
  interpolate = FALSE,
  idfactor = length(target) > 1,
  na.rm = FALSE,
  unit.out = getOption("photobiology.radiation.unit", default = "energy"),
```

```
## S3 method for class 'filter_spct'
wls_at_target(
 х,
 target = "0.5max",
 interpolate = FALSE,
  idfactor = length(target) > 1,
 na.rm = FALSE,
 filter.qty = getOption("photobiology.filter.qty", default = "transmittance"),
)
## S3 method for class 'reflector_spct'
wls_at_target(
 х,
  target = "0.5max",
  interpolate = FALSE,
  idfactor = length(target) > 1,
  na.rm = FALSE,
)
## S3 method for class 'solute_spct'
wls_at_target(
 х,
  target = "0.5max",
  interpolate = FALSE,
  idfactor = length(target) > 1,
 na.rm = FALSE,
  . . .
)
## S3 method for class 'cps_spct'
wls_at_target(
 Χ,
 target = "0.5max",
 interpolate = FALSE,
  idfactor = length(target) > 1,
 na.rm = FALSE,
)
## S3 method for class 'raw_spct'
wls_at_target(
  target = "0.5max",
  interpolate = FALSE,
```

```
idfactor = length(target) > 1,
  na.rm = FALSE,
)
## S3 method for class 'generic_mspct'
wls_at_target(
  target = "0.5max",
  interpolate = FALSE,
  idfactor = length(target) > 1,
  na.rm = FALSE,
  . . . ,
  .parallel = FALSE,
  .paropts = NULL
)
```

Arguments

data.frame or spectrum object.

target numeric or character vector. A numeric value indicates the spectral quantity

value for which wavelengths are to be searched. A character string representing a number is converted to numeric. A character value representing a number followed by a function name, will be also accepted and decoded, such that "0.1max" is interpreted as targeting one tenth of the maximum value in the column. The character strings "half.maximum" and "HM" are synonyms for

"0.5max" while "half.range" and "HR" are synonyms for "0.5range".

interpolate logical Indicating whether the nearest wavelength value in x should be returned

or a value calculated by linear interpolation between wavelength values strad-

dling the target.

idfactor logical or character Generates an index column of factor type. If idfactor =

TRUE then the column is auto named target.idx. Alternatively the column name

can be directly passed as argument to idfactor as a character string.

logical indicating whether NA values should be stripped before searching for the na.rm

target.

currently ignored.

x.var.name, y.var.name, col.name

character The name of the columns in which to search for the target value. Use of col. name is deprecated, and is a synonym for y. var. name.

character One of "energy" or "photon" unit.out

filter.qty character One of "transmittance" or "absorbance"

.parallel if TRUE, apply function in parallel, using parallel backend provided by foreach

.paropts a list of additional options passed into the foreach function when parallel computation is enabled. This is important if (for example) your code relies on external

data or packages: use the .export and .packages arguments to supply them so

that all cluster nodes have the correct environment set up for computing.

Value

A data frame, a spectrum object or a collection of spectra object of the same class as x with fewer rows, possibly even no rows. If FALSE is passed to interpolate a subset of x is returned, otherwise a new object of the same class containing interpolated wavelengths for the target value is returned. As 'target' accepts a vector or list as argument, a factor can be added to the output with the corresponding target value.

Methods (by class)

- wls_at_target(default): Default returning always an empty object of the same class as x.
- wls_at_target(data.frame): Method for "data.frame" objects.
- wls_at_target(generic_spct): Method for "generic_spct" objects.
- wls_at_target(source_spct): Method for "source_spct" objects.
- wls_at_target(response_spct): Method for "response_spct" objects.
- wls_at_target(filter_spct): Method for "filter_spct" objects.
- wls_at_target(reflector_spct): Method for "reflector_spct" objects.
- wls_at_target(solute_spct): Method for "solute_spct" objects.
- wls_at_target(cps_spct): Method for "cps_spct" objects.
- wls_at_target(raw_spct): Method for "raw_spct" objects.
- wls_at_target(generic_mspct): Method for "generic_mspct" objects.

Note

When interpolation is used, only column w.length and the column against which the target value was compared are included in the returned object, otherwise, all columns in x are returned. We implement support for data. frame to simplify the coding of 'ggplot2' stats using this function.

```

Examples

```
wls_at_target(sun.spct, target = 0.1)
wls_at_target(sun.spct, target = 2e-6, unit.out = "photon")
wls_at_target(polyester.spct, target = "HM")
wls_at_target(polyester.spct, target = "HM", interpolate = TRUE)
wls_at_target(polyester.spct, target = "HM", idfactor = "target")
wls_at_target(polyester.spct, target = "HM", filter.qty = "absorbance")
```

wl_max 451

wl_max

Wavelength maximum

Description

A method specialization that returns the wavelength maximum [nm] from objects of classes waveband or of class generic_spct or derived.

Usage

```
wl_max(x, na.rm = FALSE)
## S3 method for class 'waveband'
max(..., na.rm = FALSE)
## S3 method for class 'generic_spct'
max(..., na.rm = FALSE)
## S3 method for class 'generic_mspct'
max(..., na.rm = FALSE, idx = "spct.idx")
```

Arguments

```
    x generic_spct, generic_mspct or waveband object.
    na.rm ignored
    ... numeric, waveband or generic_spct arguments.
    idx character Name of the column with the names of the members of the collection of spectra.
```

Value

a length-one vector for individual objects or numeric vectors or a data frame for collections of spectra.

Methods (by class)

```
• max(generic_spct):
```

```
• max(generic_mspct):
```

Examples

```
max(sun.spct)
wl_max(sun.spct)
```

452 wl_midpoint

wl_midpoint

Midpoint

Description

A method that returns the wavelength [nm] (or value) at the center of the wavelength range of objects of classes waveband or of class generic_spct or derived (or the midpoint from a numeric vector).

Usage

```
wl_midpoint(x, ...)
midpoint(x, ...)
## Default S3 method:
midpoint(x, ...)
## S3 method for class 'numeric'
midpoint(x, ...)
## S3 method for class 'waveband'
midpoint(x, ...)
## S3 method for class 'generic_spct'
midpoint(x, ...)
## S3 method for class 'generic_mspct'
midpoint(x, ...)
```

Arguments

x an R object

... not used in current version

idx character Name of the column with the names of the members of the collection of spectra.

Value

A numeric value equal to $\max(x) - \min(x)$) / 2. In the case of spectral objects a wavelength [nm]. For any other R object, according to available definitions of \min and \max .

Methods (by class)

- midpoint(default): Default method for generic function
- midpoint(numeric): Default method for generic function

wl_min 453

- midpoint(waveband): Wavelength at center of a "waveband".
- midpoint(generic_spct): Method for "generic_spct".
- midpoint(generic_mspct): Method for "generic_mspct" objects.

```

Examples

```
midpoint(10:20)
midpoint(sun.spct)
wl_midpoint(sun.spct)
midpoint(sun.spct)
```

wl_min

Wavelength minimum

Description

A method specialization that returns the wavelength minimum [nm] from objects of classes waveband or of class generic_spct or derived.

Usage

```
wl_min(x, na.rm = FALSE)
## S3 method for class 'waveband'
min(..., na.rm = FALSE)
## S3 method for class 'generic_spct'
min(..., na.rm = FALSE)
## S3 method for class 'generic_mspct'
min(..., na.rm = FALSE, idx = "spct.idx")
```

Arguments

```
    x generic_spct, generic_mspct or waveband object.
    na.rm ignored
    not used in current version
    idx character Name of the column with the names of the members of the collection of spectra.
```

wl_range

Value

a length-one vector for individual objects or numeric vectors or a data frame for collections of spectra.

Methods (by class)

```
• min(generic_spct):
```

```
• min(generic_mspct):
```

See Also

```
Other wavelength summaries: wl_midpoint(), wl_range(), wl_stepsize()
```

Examples

```
min(sun.spct)
wl_min(sun.spct)
```

wl_range

Wavelength range

Description

A method specialization that returns the wavelength range [nm] from objects of classes waveband or of class generic_spct or derived.

Usage

```
wl_range(x, na.rm = FALSE)
## S3 method for class 'waveband'
range(..., na.rm = FALSE)
## S3 method for class 'generic_spct'
range(..., na.rm = FALSE)
## S3 method for class 'generic_mspct'
range(..., na.rm = FALSE, idx = "spct.idx")
```

Arguments

```
    x generic_spct, generic_mspct or waveband object.
    na.rm ignored
    ... a single R object
    idx character Name of the column with the names of the members of the collection of spectra.
```

wl_stepsize 455

Value

a length-two vector for individual objects or numeric vectors or a data frame for collections of spectra.

Methods (by class)

```
• range(generic_spct):
```

```
• range(generic_mspct):
```

See Also

```
Other wavelength summaries: wl_midpoint(), wl_min(), wl_stepsize()
```

Examples

```
range(sun.spct)
wl_range(sun.spct)
range(sun.spct)
```

wl_stepsize

Stepsize

Description

Method returning the range of step sizes in an object; i.e., the Range of differences between successive sorted values. In particular the wavelength step sizes [nm] of objects of class generic_spct or derived (or the step sizes of values in a numeric vector).

Usage

```
wl_stepsize(x, ...)
stepsize(x, ...)
## Default S3 method:
stepsize(x, ...)
## S3 method for class 'numeric'
stepsize(x, ...)
## S3 method for class 'generic_spct'
stepsize(x, ...)
## S3 method for class 'generic_mspct'
stepsize(x, ..., idx = "spct.idx")
```

456 w_length2rgb

Arguments

X	an R object
	not used in current version
idx	character Name of the column with the names of the members of the collection

of spectra.

Value

A numeric vector of length 2 with min and maximum stepsize values.

Methods (by class)

- stepsize(default): Default function usable on numeric vectors.
- stepsize(numeric): Method for numeric vectors.
- stepsize(generic_spct): Method for "generic_spct" objects.
- stepsize(generic_mspct): Method for "generic_mspct" objects.

See Also

```

```

Examples

```
stepsize(sun.spct)
wl_stepsize(sun.spct)
stepsize(sun.spct)
```

w_length2rgb

Wavelength to rgb color conversion

Description

Calculates rgb values from spectra based on human color matching functions

Usage

```
w_length2rgb(w.length, sens = photobiology::ciexyzCMF2.spct, color.name = NULL)
```

Arguments

```
w.length numeric Vector of wavelengths [nm].
sens chroma_spct Used as chromaticity definition.
color.name character Used for naming the rgb color definition.
```

w_length_range2rgb 457

Value

A vector of colors defined using rgb(). The numeric values of the RGB components can be obtained using function col2rgb().

See Also

```
Other color functions: rgb_spct(), w_length_range2rgb()
```

Examples

```
col2rgb(w_length2rgb(580))
col2rgb(w_length2rgb(c(400, 500, 600, 700)))
col2rgb(w_length2rgb(c(400, 500, 600, 700), color.name=c("a","b","c","d")))
col2rgb(w_length2rgb(c(400, 500, 600, 700), color.name="a"))
```

w_length_range2rgb

Wavelength range to rgb color conversion

Description

Calculates rgb values from spectra based on human color matching functions

Usage

```
w_length_range2rgb(
  w.length,
  sens = photobiology::ciexyzCMF2.spct,
  color.name = NULL
)
```

Arguments

w.length numeric vector of wavelengths (nm) of length 2. If longer, its range is used.

sens chroma_spct Used as the chromaticity definition.

color.name character Used for naming the rgb color definition(s) returned.

Value

A vector of colors defined using rgb(). The numeric values of the RGB components can be obtained by calling function col2rgb.

See Also

```
Other color functions: rgb_spct(), w_length2rgb()
```

^.generic_spct

Examples

```
col2rgb(w_length_range2rgb(c(500,600)))
col2rgb(w_length_range2rgb(550))
col2rgb(w_length_range2rgb(500:600))
```

^.generic_spct

Arithmetic Operators

Description

Power operator for spectra.

Usage

```
## S3 method for class 'generic_spct'
e1 ^ e2
```

Arguments

```
e1 an object of class "generic_spct"
```

e2 a numeric vector. possibly of length one.

See Also

```
