Package 'BayesianReasoning'

January 20, 2025

Type Package
Title Plot Positive and Negative Predictive Values for Medical Tests
Version 0.4.2
Date 2023-11-13

Maintainer Gorka Navarrete <gorkang@gmail.com>

Description Functions to plot and help understand positive and negative predictive values (PPV and NPV), and their relationship with sensitivity, specificity, and prevalence. See Akobeng, A.K. (2007) <doi:10.1111/j.1651-2227.2006.00180.x> for a theoretical overview of the technical concepts and Navarrete et al. (2015) for a practical explanation about the importance of their understanding <doi:10.3389/fpsyg.2015.01327>.

min_possible_prevalence

Show minimum possible prevalence given the test characteristics

Description

Given a FP and a desired PPV, what is the Minimum Prevalence of a Condition

Usage

Index

```
min_possible_prevalence(Sensitivity = 95, FP_test = 1, min_PPV_desired = 90)
```

Arguments

```
Sensitivity Sensitivity of the test: [0-100]

FP_test False positive rate (1-Specificity): [0-100]

min_PPV_desired
```

Which PPV is what you consider the minimum to trust a positive result in the test: [0-100]

Value

A description showing the minimum necessary prevalence.

```
# Example 1
min_possible_prevalence(Sensitivity = 99.9, FP_test = .1, min_PPV_desired = 70)
"To reach a PPV of 70 when using a test with 99.9 % Sensitivity and 0.1 % False Positive Rate,
you need a prevalence of at least 1 out of 429"

# Example 2
min_possible_prevalence(100, 0.1, 98)
"To reach a PPV of 98 when using a test with 100 % Sensitivity and 0.1 % False Positive Rate,
you need a prevalence of at least 1 out of 21"
```

plot_cutoff 3

plot_cutoff	plot_cutoff Create a cutoff plot, showing the healthy and sick distribu-
	tions, and the consequences of different cutoff points

Description

plot_cutoff Create a cutoff plot, showing the healthy and sick distributions, and the consequences of different cutoff points

Usage

```
plot_cutoff(
  prevalence = 0.1,
  cutoff_point = 30,
  mean_sick = 35,
  mean_healthy = 20,
  sd_sick = 3,
  sd_healthy = 5,
  n_people = 1e+05,
  add_table = FALSE,
  output_filename = NULL
)
```

Arguments

```
prevalence
                  prevalence of the disease
cutoff_point
                  cutoff point to use
                  mean for the sick people distribution
mean_sick
mean_healthy
                  mean for the healthy people distribution
sd\_sick
                  sd for the sick people distribution
sd_healthy
                  sd for the healthy people distribution
                  number of people to use
n_people
add_table
                  FALSE/TRUE: add gt table with Sensitivity, Specificity, etc.
output_filename
                  NULL. If a filename, will save the plot
```

Value

A list with plots and table

```
## Not run:
plot_cutoff(prevalence = 0.2)
## End(Not run)
```

```
PPV_diagnostic_vs_screening
```

Plot PPV values for a diagnostic and a screening group

Description

Plot PPV associated to different levels of FP and a specific Sensitivity, for two different Prevalence groups.

Usage

```
PPV_diagnostic_vs_screening(
  max_FP = 10,
  Sensitivity = 100,
  prevalence_screening_group = 100,
  prevalence_diagnostic_group = 2,
  labels_prevalence = c("Screening", "Diagnostic"),
  folder = ""
)
```

Arguments

Value

Shows a plot or, if given a folder argument, saves a .png version of the plot

```
# Example 1
PPV_diagnostic_vs_screening(
  max_FP = 10, Sensitivity = 100,
  prevalence_screening_group = 1500,
  prevalence_diagnostic_group = 3
)
# Example 2. QWith custom labels
```

PPV_heatmap 5

```
PPV_diagnostic_vs_screening(
  max_FP = 10, Sensitivity = 100,
  prevalence_screening_group = 1667,
  prevalence_diagnostic_group = 44,
  labels_prevalence = c("20 y.o.", "50 y.o.")
)
```

PPV_heatmap

Plot PPV and NPV heatmaps

Description

Plot heatmaps showing the PPV for a given Sensitivity and a range of Prevalences and False Positive values or NPV values for a given Specificity and a range of Prevalences and True Positive values

Usage

```
PPV_heatmap(
  min_Prevalence = 1,
  max_Prevalence = 1000,
  Sensitivity = NULL,
  Specificity = NULL,
  limits_Sensitivity = NULL,
  limits_Specificity = NULL,
  one_out_of = FALSE,
  overlay = "no",
  overlay_labels = "",
  overlay_extra_info = FALSE,
  overlay_position_FP = NULL,
  overlay_position_FN = NULL,
  overlay_prevalence_1 = NULL,
  overlay_prevalence_2 = NULL,
  uncertainty_prevalence = "high",
  label_title = "",
  label_subtitle = ""
  Language = "en",
  folder = "",
  PPV_NPV = "PPV",
  steps_matrix = 100,
  DEBUG = FALSE,
)
```

Arguments

```
min_Prevalence [x] out of y prevalence of disease: [1-Inf]
max_Prevalence x out of [y] prevalence of disease: [1-Inf]
```

6 PPV_heatmap

Sensitivity Sensitivity of test: [0-100]
Specificity Specificity of test: [0-100]

limits_Sensitivity

c(min Sensitivity, max Sensitivity)

limits_Specificity

c(min Specificity, max Specificity)

one_out_of Show y scale as 1 out of x [TRUE, FALSE] FALSE by default

overlay Type of overlay: ["line", "area"]

overlay_labels Labels for each point in the overlay. For example: c("80", "70", "60", "50", "40", "30", "20 y.o.")

overlay_extra_info

show extra info in overlay? [TRUE/FALSE]

overlay_position_FP

FP value (position in the x-axis) for each point in the overlay. For example: c(7, 8, 9, 12, 14, 14)

overlay_position_FN

FN value (position in the x-axis) for each point in the overlay. For example: c(7, 8, 9, 12, 14, 14)

overlay_prevalence_1

Prevalence value (position in the y-axis) for each point in the overlay. For example: c(1, 1, 1, 2, 1, 1)

overlay_prevalence_2

Prevalence value (position in the y-axis) for each point in the overlay. For example: c(26, 29, 44, 69, 227, 1667)

uncertainty_prevalence

How much certainty we have about the prevalence ["high"/"low"]

label_title Title for the plot label_subtitle Subtitle for the plot

Language for the plot labels: ["sp", "en"]

folder Where to save the plot (the filename would be automatically created using the

plot parameters)

PPV_NPV Should show PPV or NPV ["PPV", "NPV"]
steps_matrix width of PPV/NPV matrix. 100 by default
DEBUG Shows debug warnings [TRUE/FALSE]

... Other parameters. Now used to pass dpi, height and width in the Show and Save

plot section

Value

Shows a plot or, if given a folder argument, saves a .png version of the plot

Examples

```
PPV_heatmap(
   min_Prevalence = 1,
   max_Prevalence = 1000,
   Sensitivity = 100,
   Specificity = 98,
   Language = "en"
)
```

remove_layers_cutoff_plot

remove_layers_cutoff_plot Remove layers from a cutoff plot. This is useful to show how different things are calculated (e.g. Sensitivity)

Description

remove_layers_cutoff_plot Remove layers from a cutoff plot. This is useful to show how different things are calculated (e.g. Sensitivity)

Usage

```
remove_layers_cutoff_plot(cutoff_plot, delete_what, silent = TRUE)
```

Arguments

Value

a cutoff plot without the elements deleted

```
## Not run:
PLOT = plot_cutoff(prevalence = 0.2)
remove_layers_cutoff_plot(PLOT$final_plot, delete_what = c("FN", "TP")) +
ggplot2::labs(subtitle = "Specificity = TN/(TN+FP)")
## End(Not run)
```

Index

```
min_possible_prevalence, 2
plot_cutoff, 3
PPV_diagnostic_vs_screening, 4
PPV_heatmap, 5
remove_layers_cutoff_plot, 7
```
