# Package 'FactoMineR'

January 20, 2025

• '
Version 2.11
Title Multivariate Exploratory Data Analysis and Data Mining
Author Francois Husson, Julie Josse, Sebastien Le, Jeremy Mazet
Maintainer Francois Husson <francois.husson@institut-agro.fr></francois.husson@institut-agro.fr>
<b>Depends</b> R (>= $4.0$ )
$Imports \\ car, cluster, DT, ellipse, emmeans, flash Clust, graphics, gr Devices, lattice, leaps, MASS, multcomp View, scatterplot 3d, stats, utils and the control of the$
Suggests missMDA,knitr,Factoshiny,markdown
Description Exploratory data analysis methods to summarize, visualize and describe datasets. The main principal component methods are available, those with the largest potential in terms of applications: principal component analysis (PCA) when variables are quantitative, correspondence analysis (CA) and multiple correspondence analysis (MCA) when variables are categorical, Multiple Factor Analysis when variables are structured in groups, etc. and hierarchical cluster analysis. F. Husson, S. Le and J. Pages (2017).

	neR-package Multivariate Exploratory Data Analysis and Data Mining with R

# Description

The method proposed in this package are exploratory mutlivariate methods such as principal component analysis, correspondence analysis or clustering.

4 AovSum

#### **Details**

FactoMineR is a package for exploratory multivariate data analysis. The package Factoshiny gives an interface to use most of the functions of FactoMineR.

#### Author(s)

Francois Husson, Julie Josse, Sebastien Le, Jeremy Mazet Maintainer: <francois.husson@institut-agro.fr>

#### References

Le, S., Josse, J. & Husson, F. (2008). FactoMineR: An R Package for Multivariate Analysis. Journal of Statistical Software. 25(1). pp. 1-18. https://www.jstatsoft.org/v25/i01/

AovSum Analysis of variance with the contrasts sum (the sum of the coefficients is 0)

## **Description**

Analysis of variance with the contrasts sum (the sum of the coefficients is 0) Test for all the coefficients
Handle missing values

#### Usage

```
AovSum(formula, data, na.action = na.omit, ...)
```

#### **Arguments**

formula the formula for the model ' $y \sim x1 + x2 + x1 : x2$ '

data a data-frame

na.action (where relevant) information returned by model.frame on the special handling

of NAs.

... other arguments, cf the function 1m

#### Value

Retourne des objets

Ftest a table with the F-tests

Ttest a table with the t-tests

autoLab 5

#### Author(s)

Francois Husson <francois.husson@institut-agro.fr>

#### See Also

```
aov, 1m
```

# **Examples**

```
## Example two-way anova
data(senso)
res <- AovSum(Score~ Product + Day , data=senso)
res

## Example two-way anova with interaction
data(senso)
res2 <- AovSum(Score~ Product + Day + Product : Day, data=senso)
res2

## Example ancova
data(footsize)
res3 <- AovSum(footsize ~ size + sex + size : sex, data=footsize)
res3</pre>
```

autoLab

Function to better position the labels on the graphs

## **Description**

Function to better position the labels on the graphs.

#### Usage

# **Arguments**

```
x the x-coordinates
y the y-coordinates
labels the labels
cex cex
method not used
```

6 *CA* 

```
allowSmallOverlap
```

boolean

trace boolean shadotext boolean doPlot boolean

... further arguments passed to or from other methods

#### Value

See the text function

CA

Correspondence Analysis (CA)

# Description

Performs Correspondence Analysis (CA) including supplementary row and/or column points.

# Usage

```
CA(X, ncp = 5, row.sup = NULL, col.sup = NULL,
   quanti.sup=NULL, quali.sup = NULL, graph = TRUE,
axes = c(1,2), row.w = NULL, excl=NULL)
```

# Arguments

Χ	a data frame or a table with $n$ rows and $p$ columns, i.e. a contingency table
ncp	number of dimensions kept in the results (by default 5)
row.sup	a vector indicating the indexes of the supplementary rows
col.sup	a vector indicating the indexes of the supplementary columns
quanti.sup	a vector indicating the indexes of the supplementary continuous variables
quali.sup	a vector indicating the indexes of the categorical supplementary variables
graph	boolean, if TRUE a graph is displayed
axes	a length 2 vector specifying the components to plot
row.w	an optional row weights (by default, a vector of 1 and each row has a weight equals to its margin); the weights are given only for the active rows
excl	numeric vector indicating the indexes of the "junk" columns (default is NULL). Useful for MCA with excl argument.

*CA* 7

## Value

## Returns a list including:

eig	a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
col	a list of matrices with all the results for the column variable (coordinates, square cosine, contributions, inertia)
row	a list of matrices with all the results for the row variable (coordinates, square cosine, contributions, inertia)
col.sup	a list of matrices containing all the results for the supplementary column points (coordinates, square cosine)
row.sup	a list of matrices containing all the results for the supplementary row points (coordinates, square cosine)
quanti.sup	if quanti.sup is not NULL, a matrix containing the results for the supplementary continuous variables (coordinates, square cosine)
quali.sup	if quali.sup is not NULL, a list of matrices with all the results for the supplementary categorical variables (coordinates of each categories of each variables, v.test which is a criterion with a Normal distribution, square correlation ratio)
call	a list with some statistics

Returns the row and column points factor map.

The plot may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the plot.CA function.

```
data(children)
res.ca <- CA (children, row.sup = 15:18, col.sup = 6:8)
summary(res.ca)
## Ellipses for all the active elements
ellipseCA(res.ca)
## Ellipses around some columns only
ellipseCA(res.ca,ellipse="col",col.col.ell=c(rep("blue",2),rep("transparent",3)),
        invisible=c("row.sup","col.sup"))
## Not run:
## Graphical interface
require(Factoshiny)
res <- Factoshiny(children)
## End(Not run)</pre>
```

CaGalt

Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt)

#### **Description**

Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt) aims at expanding correspondence analysis on an aggregated lexical table to the case of several quantitative and categorical variables with the objective of establishing a typology of the variables and a typology of the frequencies from their mutual relationships. To avoid the instability issued from multicollinearity among the contextual variables and limit the influence of noisy measurements, the contextual variables are substituted by their principal components. Validation tests in the form of confidence ellipses for the frequencies and the variables are also proposed.

#### Usage

```
CaGalt(Y, X, type="s", conf.ellip=FALSE, nb.ellip=100, level.ventil=0,
    sx=NULL, graph=TRUE, axes=c(1,2))
```

#### **Arguments**

Υ	a data frame with n rows (individuals) and p columns (frequencies)
X	a data frame with n rows (individuals) and k columns (quantitative or categorical variables) $ \\$
type	the type of variables: "c" or "s" for quantitative variables and "n" for categorical variables. The difference is that for "s" variables are scaled to unit variance (by default, variables are scaled to unit variance)
conf.ellip	boolean (FALSE by default), if TRUE, draw confidence ellipses around the frequencies and the variables when "graph" is TRUE
nb.ellip	number of bootstrap samples to compute the confidence ellipses (by default 100)

CaGalt 9

level.ventil	proportion corresponding to the level under which the category is ventilated; by default, 0 and no ventilation is done. Available only when type is equal to "n"
sx	number of principal components kept from the principal axes analysis of the contextual variables (by default is NULL and all principal components are kept)
graph	boolean, if TRUE a graph is displayed
axes	a length 2 vector specifying the components to plot

## Value

# Returns a list including:

eig	a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
ind	a list of matrices containing all the results for the individuals (coordinates, square cosine)
freq	a list of matrices containing all the results for the frequencies (coordinates, square cosine, contributions)
quanti.var	a list of matrices containing all the results for the quantitative variables (coordinates, correlation between variables and axes, square cosine)
quali.var	a list of matrices containing all the results for the categorical variables (coordinates of each categories of each variables, square cosine)
ellip	a list of matrices containing the coordinates of the frequencies and variables for replicated samples from which the confidence ellipses are constructed

Returns the individuals, the frequencies and the variables factor map. If there are more than 50 frequencies, the first 50 frequencies that have the highest contribution on the 2 dimensions of your plot are drawn. The plots may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the plot.CaGalt function.

catdes

Categories description

# Description

Description of the categories of one factor by categorical variables and/or by quantitative variables

# Usage

```
catdes(donnee,num.var,proba = 0.05, row.w = NULL, na.method="NA")
```

## **Arguments**

3	
donnee	a data frame made up of at least one categorical variables and a set of quantitative variables and/or categorical variables
num.var	the indice of the variable to characterized
proba	the significance threshold considered to characterized the category (by default $0.05$ )
row.w	a vector of integers corresponding to an optional row weights (by default, a vector of 1 for uniform row weights)
na.method	a boolean that says how to manage missing values. If ; if na.method="NA" a new category is considered for the categorical variable; if na.method="na.omit" the missing values are deleted

#### Value

# Returns a list including:

test.chi	The categorical variables which characterized the factor are listed in ascending order (from the one which characterized the most the factor to the one which significantly characterized with the proba proba
category	description of each category of the num. var by each category of all the categorical variables
quanti.var	the global description of the num. var variable by the quantitative variables with the square correlation coefficient and the p-value of the F-test in a one-way analysis of variance (assuming the hypothesis of homoscedsticity)
quanti	the description of each category of the num.var variable by the quantitative variables

catdes(wine, num.var=2)
```

children

Children (data)

#### **Description**

The data used here is a contingency table that summarizes the answers given by different categories of people to the following question: according to you, what are the reasons that can make hesitate a woman or a couple to have children?

#### Usage

```
data(children)
```

#### **Format**

A data frame with 18 rows and 8 columns. Rows represent the different reasons mentioned, columns represent the different categories (education, age) people belong to.

#### **Source**

Traitements Statistiques des Enquetes (D. Grange, L. Lebart, eds.) Dunod, 1993

```
data(children)
res.ca <- CA (children, row.sup = 15:18, col.sup = 6:8)</pre>
```

12 coeffRV

റല		

Calculate the RV coefficient and test its significance

#### Description

Calculate the RV coefficient and test its significance.

## Usage

```
coeffRV(X, Y)
```

# **Arguments**

X a matrix with *n* rows (individuals) and *p* numerous columns (variables)
Y a matrix with *n* rows (individuals) and *p* numerous columns (variables)

#### **Details**

Calculates the RV coefficient between X and Y. It returns also the standardized RV, the expectation, the variance and the skewness under the permutation distribution. These moments are used to approximate the exact distribution of the RV statistic with the Pearson type III approximation and the p-value associated to this test is given.

#### Value

A list containing the following components:

RV the RV coefficient between the two matrices

RVs the standardized RV coefficients

mean the mean of the RV permutation distribution
variance the variance of the RV permutation distribution
skewness the skewness of the RV permutation distribution

p.value the p-value associated to the test of the significativity of the RV coefficient (with

the Pearson type III approximation

data(wine)
X <- wine[,3:7]
Y <- wine[,11:20]
coeffRV(X,Y)</pre>
```

condes

Continuous variable description

## Description

Description continuous by quantitative variables and/or by categorical variables

## Usage

```
condes(donnee,num.var,weights=NULL,proba = 0.05)
```

#### **Arguments**

donnee a data frame made up of at least one quantitative variable and a set of quantitative

variables and/or categorical variables

num. var the number of the variable to characterized

weights weights for the individuals; if NULL, all individuals has a weight equals to 1; the

sum of the weights can be equal to 1 and then the weights will be multiplied by the number of individuals, the sum can be greater than the number of individuals

proba the significance threshold considered to characterized the category (by default

0.05)

#### Value

## Returns a list including:

quanti the description of the num.var variable by the quantitative variables. The vari-

ables are sorted in ascending order (from the one which characterized the most

to the one which significantly characterized with the proba proba)

quali The categorical variables which characterized the continuous variables are listed

in ascending order

category description of the continuous variable num. var by each category of all the cate-

gorical variables

#### Author(s)

Francois Husson <francois.husson@institut-agro.fr>

#### See Also

catdes

14 coord.ellipse

#### **Examples**

```
data(decathlon)
condes(decathlon, num.var=3)
```

coord.ellipse

Construct confidence ellipses

#### **Description**

Construct confidence ellipses

## Usage

```
coord.ellipse (coord.simul, centre = NULL, axes = c(1, 2),
    level.conf = 0.95, npoint = 100, bary = FALSE)
```

#### **Arguments**

coord.simul a data frame containing the coordinates of the individuals for which the confi-

dence ellipses are constructed. This data frame can contain more than 2 variables; the variables taken into account are chosen after. The first column must be a factor which allows to associate one row to an ellipse. The simule object of

the result of the simule function correspond to a data frame.

centre a data frame whose columns are the same than those of the coord.simul, and

with the coordinates of the centre of each ellipse. This parameter is optional and NULL by default; in this case, the centre of the ellipses is calculated from the

data

axes a length 2 vector specifying the components of coord simul that are taken into

account

level.conf confidence level used to construct the ellipses. By default, 0.95

npoint number of points used to draw the ellipses

bary boolean, if bary = TRUE, the coordinates of the ellipse around the barycentre of

individuals are calculated

Value

res a data frame with (npoint times the number of ellipses) rows and three columns.

The first column is the factor of coord.simul, the two others columns give the

coordinates of the ellipses on the two dimensions chosen.

the parameters of the function chosen

aa <- cbind.data.frame(decathlon[,13],res.pca$ind$coord)
bb <- coord.ellipse(aa,bary=TRUE)
plot(res.pca,habillage=13,ellipse=bb)
## To automatically draw ellipses around the barycentres of all the categorical variables
plotellipses(res.pca)</pre>
```

decathlon

Performance in decathlon (data)

# **Description**

The data used here refer to athletes' performance during two sporting events.

# Usage

```
data(decathlon)
```

#### **Format**

A data frame with 41 rows and 13 columns: the first ten columns corresponds to the performance of the athletes for the 10 events of the decathlon. The columns 11 and 12 correspond respectively to the rank and the points obtained. The last column is a categorical variable corresponding to the sporting event (2004 Olympic Game or 2004 Decastar)

#### **Source**

Department of statistics and computer science, Agrocampus Rennes

```
data(decathlon)
res.pca <- PCA(decathlon, quanti.sup = 11:12, quali.sup=13)</pre>
```

16 descfreq

descfreq	Description of frequencies
·	1 00 1

# **Description**

Description of the rows of a contingency table or of groups of rows of a contingency table

#### Usage

```
descfreq(donnee, by.quali = NULL, proba = 0.05)
```

#### **Arguments**

donnee a data frame corresponding to a contingency table (quantitative data)

by quali a factor used to merge the data from different rows of the contingency table; by

default NULL and each row is characterized

proba the significance threshold considered to characterized the category (by default

0.05)

#### Value

Returns a list with the characterization of each rows or each group of the by.quali. A test corresponding to the hypergeometric distribution is performed and the probability to observe a more extreme value than the one observed is calculated. For each row (or category), each of the columns characterising the row are sorted in ascending order of p-value.

dimdesc 17

dimdesc Dimension description
-------------------------------

#### **Description**

This function is designed to point out the variables and the categories that are the most characteristic according to each dimension obtained by a Factor Analysis.

## Usage

```
dimdesc(res, axes = 1:3, proba = 0.05)
```

## **Arguments**

res an object of class PCA, MCA, CA, MFA or HMFA

axes a vector with the dimensions to describe

proba the significance threshold considered to characterized the dimension (by default

0.05)

#### Value

Returns a list including:

quanti the description of the dimensions by the quantitative variables. The variables

are sorted.

quali the description of the dimensions by the categorical variables

#### Author(s)

François Husson <françois.husson@institut-agro.fr>

DMFA

DMFA Dual Multiple Factor Analysis (DMFA)
---

# Description

Performs Dual Multiple Factor Analysis (DMFA) with supplementary individuals, supplementary quantitative variables and supplementary categorical variables.

# Usage

```
DMFA(don, num.fact = ncol(don), scale.unit = TRUE, ncp = 5,
    quanti.sup = NULL, quali.sup = NULL, graph = TRUE, axes=c(1,2))
```

# Arguments

don	a data frame with $n$ rows (individuals) and $p$ columns (numeric variables)
num.fact	the number of the categorical variable which allows to make the group of individuals
scale.unit	a boolean, if TRUE (value set by default) then data are scaled to unit variance
ncp	number of dimensions kept in the results (by default 5)
quanti.sup	a vector indicating the indexes of the quantitative supplementary variables
quali.sup	a vector indicating the indexes of the categorical supplementary variables
graph	boolean, if TRUE a graph is displayed
axes	a length 2 vector specifying the components to plot

# Value

# Returns a list including:

eig	a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
var	a list of matrices containing all the results for the active variables (coordinates, correlation between variables and axes, square cosine, contributions)
ind	a list of matrices containing all the results for the active individuals (coordinates, square cosine, contributions)
ind.sup	a list of matrices containing all the results for the supplementary individuals (coordinates, square cosine)
quanti.sup	a list of matrices containing all the results for the supplementary quantitative variables (coordinates, correlation between variables and axes)
quali.sup	a list of matrices containing all the results for the supplementary categorical variables (coordinates of each categories of each variables, and v.test which is a criterion with a Normal distribution)
svd	the result of the singular value decomposition

ellipseCA 19

var.partiel a list with the partial coordinate of the variables for each group

cor.dim.gr

Xc a list with the data centered by group

group a list with the results for the groups (cordinate, normalized coordinates, cos2)

Cov a list with the covariance matrices for each group

Returns the individuals factor map and the variables factor map.

## Author(s)

Francois Husson <francois.husson@institut-agro.fr>

#### See Also

```
plot.DMFA, dimdesc
```

## **Examples**

```
## Example with the famous Fisher's iris data
res.dmfa = DMFA ( iris, num.fact = 5)
```

ellipseCA

Draw confidence ellipses in CA

#### **Description**

Draw confidence ellipses in CA around rows and/or columns.

## Usage

```
ellipseCA (x, ellipse=c("col","row"), method="multinomial", nbsample=100,
    axes=c(1,2), xlim=NULL, ylim=NULL, col.row="blue", col.col="red",
col.row.ell=col.row, col.col.ell=col.col,
graph.type = c("ggplot","classic"), ggoptions = NULL, ...)
```

## Arguments

X	an object of class CA
ellipse	a vector of character that defines which ellipses are drawn
method	the method to construct ellipses (see details below)
nbsample	number of samples drawn to evaluate the stability of the points
axes	a length 2 vector specifying the components to plot
xlim	range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim	range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
col.row	a color for the rows points

20 ellipseCA

col.col	a color for columns points
col.row.ell	a color for the ellipses of rows points (the color "transparent" can be used if an ellipse should not be drawn)
col.col.ell	a color for the ellipses of columns points (the color "transparent" can be used if an ellipse should not be drawn)
graph.type	a character that gives the type of graph used: "ggplot" or "classic"
ggoptions	a list that gives the graph options when grah.type="ggplot" is used. See the optines and the default values in the details section
	further arguments passed to or from the plot.CA function, such as title, invisible,

#### **Details**

With method="multinomial", the table X with the active elements is taken as a reference. Then new data tables are drawn in the following way: N (the sum of X) values are drawn from a multinomial distribution with theoretical frequencies equals to the values in the cells divided by N.

With method="boot", the values are bootstrapped row by row: Ni (the sum of row i in the X table) values are taken in a vector with Nij equals to column j (with j varying from 1 to J).

Thus nbsample new datasets are drawn and projected as supplementary rows and/or supplementary columns. Then confidence ellipses are drawn for each elements thanks to the nbsample supplementary points.

#### Value

Returns the factor map with the joint plot of CA with ellipses around some elements.

estim\_ncp 21

estim_ncp	Estimate the number of components in Principal Component Analysis

## **Description**

Estimate the number of components in PCA.

## Usage

```
estim_ncp(X, ncp.min=0, ncp.max=NULL, scale=TRUE, method="GCV")
```

# Arguments

Χ	a data frame with continuous variables
ncp.min	minimum number of dimensions to interpret, by default 0
ncp.max	maximum number of dimensions to interpret, by default NULL which corresponds to the number of columns minus $2$
scale	a boolean, if TRUE (value set by default) then data are scaled to unit variance
method	method used to estimate the number of components, "GCV" for the generalized cross-validation approximation or "Smooth" for the smoothing method (by default "GCV")

#### Value

Returns ncp the best number of dimensions to use (find the minimum or the first local minimum) and the mean error for each dimension tested

22 FAMD

EAMD	
FAMD	Factor Analysis for Mixed Data

#### **Description**

FAMD is a principal component method dedicated to explore data with both continuous and categorical variables. It can be seen roughly as a mixed between PCA and MCA. More precisely, the continuous variables are scaled to unit variance and the categorical variables are transformed into a disjunctive data table (crisp coding) and then scaled using the specific scaling of MCA. This ensures to balance the influence of both continuous and categorical variables in the analysis. It means that both variables are on a equal foot to determine the dimensions of variability. This method allows one to study the similarities between individuals taking into account mixed variables and to study the relationships between all the variables. It also provides graphical outputs such as the representation of the individuals, the correlation circle for the continuous variables and representations of the categories of the categorical variables, and also specific graphs to visulaize the associations between both type of variables.

# Usage

```
FAMD (base, ncp = 5, graph = TRUE, sup.var = NULL,
  ind.sup = NULL, axes = c(1,2), row.w = NULL, tab.disj = NULL)
```

#### **Arguments**

base	a data frame with $n$ rows (individuals) and $p$ columns
ncp	number of dimensions kept in the results (by default 5)
graph	boolean, if TRUE a graph is displayed
ind.sup	a vector indicating the indexes of the supplementary individuals
sup.var	a vector indicating the indexes of the supplementary variables
axes	a length 2 vector specifying the components to plot
row.w	an optional row weights (by default, uniform row weights); the weights are given only for the active individuals
tab.disj	object obtained from the imputeFAMD function of the missMDA package that allows to handle missing values

# Value

#### Returns a list including:

eig	a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
var	a list of matrices containing all the results for the variables considered as group (coordinates, square cosine, contributions)
ind	a list of matrices with all the results for the individuals (coordinates, square cosine, contributions)

footsize 23

quali.var a list of matrices with all the results for the categorical variables (coordinates,

square cosine, contributions, v.test)

quanti.var a list of matrices with all the results for the quantitative variables (coordinates,

correlation, square cosine, contributions)

call a list with some statistics

Returns the individuals factor map.

GPA 25

GPA Generalised Procrustes Analysis	GPA	Generalised Procrustes Analysis
-------------------------------------	-----	---------------------------------

## **Description**

Performs Generalised Procrustes Analysis (GPA) that takes into account missing values.

# Usage

```
GPA(df, tolerance=10^-10, nbiteration=200, scale=TRUE,
    group, name.group = NULL, graph = TRUE, axes = c(1,2))
```

## **Arguments**

df	a data frame with $n$ rows (individuals) and $p$ columns (quantitative variables)
tolerance	a threshold with respect to which the algorithm stops, i.e. when the difference between the GPA loss function at step $n$ and $n+1$ is less than tolerance
nbiteration	the maximum number of iterations until the algorithm stops
scale	a boolean, if TRUE (which is the default value) scaling is required
group	a vector indicating the number of variables in each group
name.group	a vector indicating the name of the groups (the groups are successively named group.1, group.2 and so on, by default)
graph	boolean, if TRUE a graph is displayed
axes	a length 2 vector specifying the components to plot

#### **Details**

Performs a Generalised Procrustes Analysis (GPA) that takes into account missing values: some data frames of df may have non described or non evaluated rows, i.e. rows with missing values only.

The algorithm used here is the one developed by Commandeur.

#### Value

A list containing the following components:

RV	a matrix of RV coefficients between partial configurations
RVs	a matrix of standardized RV coefficients between partial configurations
simi	a matrix of Procrustes similarity indexes between partial configurations
scaling	a vector of isotropic scaling factors
dep	an array of initial partial configurations
consensus	a matrix of consensus configuration
Xfin	an array of partial configurations after transformations

26 graph.var

correlations correlation matrix between initial partial configurations and consensus dimen-

sions

PANOVA a list of "Procrustes Analysis of Variance" tables, per assesor (config), per prod-

uct(objet), per dimension (dimension)

#### **Examples**

graph.var

Make graph of variables

# Description

Plot the graphs of the variables after a Factor Analysis.

#### Usage

```
graph.var(x, axes = c(1, 2),
    xlim = NULL, ylim = NULL, col.sup = "blue",
    col.var = "black", draw="all", label=draw, lim.cos2.var = 0.1,
    cex = 1, title = NULL, new.plot = TRUE, ...)
```

graph.var 27

# Arguments

x	an object of class PCA, MCA, MFA or HMFA
axes	a length 2 vector specifying the components to plot
xlim	range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim	range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
col.sup	a color for the quantitative supplementary variables
col.var	a color for the variables
draw	a list of character for the variables which are drawn (by default, all the variables are drawn). You can draw all the active variables by putting "var" and/or all the supplementary variables by putting "quanti.sup" and/or a list with the names of the variables which should be drawn
label	a list of character for the variables which are labelled (by default, all the drawn variables are labelled). You can label all the active variables by putting "var" and/or all the supplementary variables by putting "quanti.sup" and/or a list with the names of the variables which should be labelled
lim.cos2.var	value of the square cosinus under the variables are not drawn
cex	cf. function par in the <b>graphics</b> package
title	string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
new.plot	boolean, if TRUE, a new graphical device is created
	further arguments passed to or from other methods

# Value

Returns the variables factor map.

    label = c("Long.jump", "Points"))</pre>
```

28 HCPC

НСРС	Hierarchical Clustering on Principle Components (HCPC)

# Description

Performs an agglomerative hierarchical clustering on results from a factor analysis. It is possible to cut the tree by clicking at the suggested (or an other) level. Results include paragons, description of the clusters, graphics.

# Usage

```
HCPC(res, nb.clust=0, consol=TRUE, iter.max=10, min=3,
  max=NULL, metric="euclidean", method="ward", order=TRUE,
  graph.scale="inertia", nb.par=5, graph=TRUE, proba=0.05,
  cluster.CA="rows",kk=Inf,description=TRUE,...)
```

## **Arguments**

res	Either the result of a factor analysis or a dataframe.
nb.clust	an integer. If 0, the tree is cut at the level the user clicks on. If -1, the tree is automatically cut at the suggested level (see details). If a (positive) integer, the tree is cut with nb.cluters clusters.
consol	a boolean. If TRUE, a k-means consolidation is performed (consolidation cannot be performed if kk is used and equals a number).
iter.max	An integer. The maximum number of iterations for the consolidation.
min	an integer. The least possible number of clusters suggested.
max	an integer. The higher possible number of clusters suggested; by default the minimum between 10 and the number of individuals divided by 2.
metric	The metric used to built the tree. See agnes for details.
method	The method used to built the tree. See agnes for details.
order	A boolean. If TRUE, clusters are ordered following their center coordinate on the first axis.
graph.scale	A character string. By default "inertia" and the height of the tree corresponds to the inertia gain, else "sqrt-inertia" the square root of the inertia gain.
nb.par	An integer. The number of edited paragons.
graph	If TRUE, graphics are displayed. If FALSE, no graph are displayed.
proba	The probability used to select axes and variables in catdes (see catdes for details.
cluster.CA	A string equals to "rows" or "columns" for the clustering of Correspondence Analysis results.

HCPC 29

An integer corresponding to the number of clusters used in a Kmeans preprocessing before the hierarchical clustering; the top of the hierarchical tree is then constructed from this partition. This is very useful if the number of individuals is high. Note that consolidation cannot be performed if kk is different from Inf and some graphics are not drawn. Inf is used by default and no preprocessing is done, all the graphical outputs are then given.

description boolean; if TRUE the clusters are characterized by the variables and the dimen-

sions

... Other arguments from other methods.

#### **Details**

The function first built a hierarchical tree. Then the sum of the within-cluster inertia are calculated for each partition. The suggested partition is the one with the higher relative loss of inertia (i(clusters n+1)/i(cluster n)).

The absolute loss of inertia (i(cluster n)-i(cluster n+1)) is plotted with the tree.

If the ascending clustering is constructed from a data-frame with a lot of rows (individuals), it is possible to first perform a partition with kk clusters and then construct the tree from the (weighted) kk clusters.

#### Value

Returns a list including:

data.clust	The original data with a supplementary column called clust containing the partition.
desc.var	The description of the classes by the variables. See catdes for details or descfreq if clustering is performed on CA results.
desc.axes	The description of the classes by the factors (axes). See catdles for details.
call	A list or parameters and internal objects. call\$t gives the results for the hierarchical tree; call\$bw.before.consol and call\$bw.after.consol give the between inertia before consolidation (i.e. for the clustering obtained from the hierarchical tree) and after the consolidation with Kmeans.
desc.ind	The paragons (para) and the more typical individuals of each cluster. See details.

Returns the tree and a barplot of the inertia gains, the individual factor map with the tree (3D), the factor map with individuals coloured by cluster (2D).

res <- Factoshiny(iris[,1:4])

## End(Not run)</pre>
```

health

health (data)

#### **Description**

In 1989-1990 the Valencian Institute of Public Health (IVESP) conducted a survey to better know the attitudes and opinions related to health for the non-expert population. The first question included in the questionnaire "What does health mean to you?" required free and spontaneous answers. A priori, the variables Age group (under 21, 21-35, 36-50 and over 50), Health condition (poor, fair, good and very good health) and Gender were considered as possibly conditioning the respondents' viewpoint on health.

#### Usage

```
data(health)
```

## **Format**

A data frame with 392 rows and 118 columns. Rows represent the individuals (respondents), columns represent the words used at least 10 times to answer the open-ended question (columns 1 to 115) and respondents' characteristics (age, health condition and gender)

```
## Not run:
data(health)
res.cagalt<-CaGalt(Y=health[,1:115],X=health[,116:118],type="n")
## End(Not run)</pre>
```

HMFA 31

HMFA Hierarchical Multiple Factor Analysis	HMFA	Hierarchical Multiple Factor Analysis	
--	------	---------------------------------------	--

# Description

Performs a hierarchical multiple factor analysis, using an object of class list of data.frame.

# Usage

```
HMFA(X,H,type = rep("s", length(H[[1]])), ncp = 5, graph = TRUE, axes = c(1,2), name.group = NULL)
```

# Arguments

Χ	a data.frame
Н	a list with one vector for each hierarchical level; in each vector the number of variables or the number of group constituting the group
type	the type of variables in each group in the first partition; three possibilities: "c" or "s" for quantitative variables (the difference is that for "s", the variables are scaled in the program), "n" for categorical variables; by default, all the variables are quantitative and the variables are scaled unit
ncp	number of dimensions kept in the results (by default 5)
graph	boolean, if TRUE a graph is displayed
axes	a length 2 vector specifying the components to plot
name.group	a list of vector containing the name of the groups for each level of the hierarchy (by default, NULL and the group are named L1.G1, L1.G2 and so on)

# Value

# Returns a list including:

eig	a matrix containing all the eigenvalues, the percentage of variance and the cu- mulative percentage of variance
group	a list with first a list of matrices with the coordinates of the groups for each level and second a matrix with the canonical correlation (correlation between the coordinates of the individuals and the partial points))
ind	a list of matrices with all the results for the active individuals (coordinates, square cosine, contributions)
quanti.var	a list of matrices with all the results for the quantitative variables (coordinates, correlation between variables and axes)
quali.var	a list of matrices with all the results for the supplementary categorical variables (coordinates of each categories of each variables, and v.test which is a criterion with a Normal distribution)
partial	a list of arrays with the coordinates of the partial points for each partition

```

hobbies

hobbies (data)

#### **Description**

The data used here concern a questionnaire on hobbies. We asked to 8403 individuals how answer questions about their hobbies (18 questions). The following four variables were used to label the individuals: sex (male, female), age (15-25, 26-35, 36-45, 46-55, 56-65, 66-75, 76-85, 86-100), marital status (single, married, widowed,divorced, remarried), profession (manual labourer, unskilled worker, technician, foreman, senior management, employee, other). And finally, a quantitative variable indicates the number of hobbies practised out of the 18 possible choices.

#### Usage

```
data(tea)
```

#### **Format**

A data frame with 8403 rows and 23 columns. Rows represent the individuals, columns represent the different questions. The first 18 questions are active ones, and the 4 following ones are supplementary categorical variables and the 23th is a supplementary quantitative variable (the number of activities)

JO 33

## End(Not run)</pre>
```

JO

Number of medals in athletism during olympic games per country

# Description

This data frame is a contengency table with the athletism events (in row) and the coutries (in columns). Each cell gives the number of medals obtained during the 5 olympis games from 1992 to 2008 (Barcelona 1992, Atlanta 1996, Sydney 2000, Athens 2004, Beijing 2008).

## Usage

```
data(J0)
```

#### **Format**

A data frame with the 24 events in athletism and in colum the 58 countries who obtained at least on medal

```
## Not run:
data(J0)
res.ca <- CA(J0)
res.ca <- CA(J0, axes = 3:4)
## End(Not run)</pre>
```

34 LinearModel

LinearModel	Linear Model with AIC or BIC selection, and with the contrasts sum (the sum of the coefficients is 0) if any categorical variables

## **Description**

Linear Model with AIC or BIC selection, and with the contrasts sum (the sum of the coefficients is 0) if any categorical variables
Test for all the coefficients
Handle missing values

## Usage

## **Arguments**

formula	the formula for the model 'y~x1+x2+x1:x2'
data	a data-frame
na.action	(where relevant) information returned by model.frame on the special handling of NAs.
type	type of test, "III", "II", $3$ or $2$ . Roman numerals are equivalent to the corresponding Arabic numerals.
selection	a string that defines the model selection according to "BIC" for Bayesian Information Criterion or "AIC" for Akaike Information Criterion; "none", by defaut, means that there is no selection.
	other arguments, cf the function 1m

#### **Details**

The Anova function of the package car is used to calculate the F-tests.

The t-tests are obtained using the contrasts "contr.sum" which means that 'sum to zero contrasts'.

A stepwise procedure (using both backword and forward selections) is performed to select a model if selection="AIC" or selection="BIC".

#### Value

The outouts

Ftest a table with the F-tests

Ttest a table with the t-tests

lmResult the summary of the function lm

call the matched call

MCA 35

lmResultComp the summary of the lm function for the complete model (given only if a selection

is performed)

callComp the matched call for the complete model (given only if a selection is performed)

MCA

Multiple Correspondence Analysis (MCA)

## **Description**

Performs Multiple Correspondence Analysis (MCA) with supplementary individuals, supplementary quantitative variables and supplementary categorical variables.

Performs also Specific Multiple Correspondence Analysis with supplementary categories and supplementary categorical variables.

Missing values are treated as an additional level, categories which are rare can be ventilated

36 MCA

#### Usage

```
MCA(X, ncp = 5, ind.sup = NULL, quanti.sup = NULL,
    quali.sup = NULL, excl=NULL, graph = TRUE,
level.ventil = 0, axes = c(1,2), row.w = NULL,
method="Indicator", na.method="NA", tab.disj=NULL)
```

#### **Arguments**

X a data frame with *n* rows (individuals) and *p* columns (categorical variables) ncp number of dimensions kept in the results (by default 5)

ind. sup a vector indicating the indexes of the supplementary individuals

quanti.sup a vector indicating the indexes of the quantitative supplementary variables a vector indicating the indexes of the categorical supplementary variables

excl vector indicating the indexes of the "junk" categories (default is NULL), it can

be a vector of the names of the categories or a vector of the indexes in the

disjunctive data table

graph boolean, if TRUE a graph is displayed

level.ventil a proportion corresponding to the level under which the category is ventilated;

by default, 0 and no ventilation is done

axes a length 2 vector specifying the components to plot

row.w an optional row weights (by default, a vector of 1 for uniform row weights); the

weights are given only for the active individuals

method a string corresponding to the name of the method used: "Indicator" (by default)

is the CA on the Indicator matrix, "Burt" is the CA on the Burt table. For Burt and the Indicator, the graph of the individuals and the graph of the categories are

given

na.method a string corresponding to the name of the method used if there are missing val-

ues; available methods are "NA" or "Average" (by default, "NA")

tab.disj optional data.frame corresponding to the disjunctive table used for the analy-

sis; it corresponds to a disjunctive table obtained from imputation method (see

package missMDA).

#### Value

# Returns a list including:

eig a matrix containing all the eigenvalues, the percentage of variance and the cu-

mulative percentage of variance

var a list of matrices containing all the results for the active variables (coordinates,

square cosine, contributions, v.test, square correlation ratio)

ind a list of matrices containing all the results for the active individuals (coordinates,

square cosine, contributions)

ind. sup a list of matrices containing all the results for the supplementary individuals

(coordinates, square cosine)

MCA 37

quanti.sup	a matrix containing the coordinates of the supplementary quantitative variables (the correlation between a variable and an axis is equal to the variable coordinate on the axis)
quali.sup	a list of matrices with all the results for the supplementary categorical variables (coordinates of each categories of each variables, square cosine and v.test which is a criterion with a Normal distribution, square correlation ratio)
call	a list with some statistics

Returns the graphs of the individuals and categories and the graph with the variables. The plots may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the plot. MCA function.

## End(Not run)</pre>
```

meansComp

Perform pairwise means comparisons

## **Description**

Perform means comparisons and give groups of means that are not significantly different.

## Usage

```
meansComp(object, spec, graph=TRUE, ...)
```

# **Arguments**

object A fitted model object that is supported, such as the result of a call to Linear-

Model, Im or aov.

spec A character vector specifying the names of the predictors over which means

comparisons are desired. specs may also be a formula or a list (optionally named) of valid specs. Use of formulas is described in the Overview section

below.

graph Boolean; plot the graph to compare the means.

... other arguments, cf the function emmeans.

MFA

Multiple Factor Analysis (MFA)

## **Description**

Performs Multiple Factor Analysis in the sense of Escofier-Pages with supplementary individuals and supplementary groups of variables. Groups of variables can be quantitative, categorical or contingency tables.

Specific Multiple Fac tor Analysis can be performed using the argument excl.

Missing values in numeric variables are replaced by the column mean.

Missing values in categorical variables are treated as an additional level.

## Usage

```
MFA (base, group, type = rep("s",length(group)), excl = NULL,
  ind.sup = NULL, ncp = 5, name.group = NULL,
  num.group.sup = NULL, graph = TRUE, weight.col.mfa = NULL,
  row.w = NULL, axes = c(1,2), tab.comp=NULL)
```

## **Arguments**

base	a data frame with $n$ rows (individuals) and $p$ columns (variables)
group	a vector with the number of variables in each group
type	the type of variables in each group; four possibilities: "c" or "s" for quantitative variables (the difference is that for "s" variables are scaled to unit variance), "n" for categorical variables "m" for group of mixed variables and "f" for frequencies (from a contingency tables); by default, all variables are quantitative and scaled to unit variance
excl	an argument that may possible to exclude categories of active variables of categorical variable groups. NULL by default, it is a list with indexes of categories that are excluded per group
ind.sup	a vector indicating the indexes of the supplementary individuals
ncp	number of dimensions kept in the results (by default 5)
name.group	a vector containing the name of the groups (by default, NULL and the group are

named group.1, group.2 and so on)

40 MFA

num.group.sup the indexes of the illustrative groups (by default, NULL and no group are illus-

trative)

graph boolean, if TRUE a graph is displayed

weight.col.mfa vector of weights, useful for HMFA method (by default, NULL and an MFA is

performed)

row.w an optional row weights (by default, a vector of 1 for uniform row weights); the

weights are given only for the active individuals

axes a length 2 vector specifying the components to plot

tab.comp object obtained from the imputeMFA function of the missMDA package that

allows to handle missing values

#### Value

summary.quali a summary of the results for the categorical variables summary.quanti a summary of the results for the quantitative variables separate.analyses

the results for the separate analyses

eig a matrix containing all the eigenvalues, the percentage of variance and the cu-

mulative percentage of variance

group a list of matrices containing all the results for the groups (Lg and RV coefficients,

coordinates, square cosine, contributions, distance to the origin, the correlations

between each group and each factor)

rapport.inertie

inertia ratio

ind a list of matrices containing all the results for the active individuals (coordinates,

square cosine, contributions)

ind.sup a list of matrices containing all the results for the supplementary individuals

(coordinates, square cosine)

quanti.var a list of matrices containing all the results for the quantitative variables (coordi-

nates, correlation between variables and axes, contribution, cos2)

quali.var a list of matrices containing all the results for categorical variables (coordinates

of each categories of each variables, contribution and v.test which is a criterion

with a Normal distribution)

freq a list of matrices containing all the results for the frequencies (coordinates, con-

tribution, cos2)

quanti.var.sup a list of matrices containing all the results for the supplementary quantitative

variables (coordinates, correlation between variables and axes, cos2)

quali.var.sup a list of matrices containing all the results for the supplementary categorical

variables (coordinates of each categories of each variables, cos2 and v.test which

is a criterion with a Normal distribution)

freq. sup a list of matrices containing all the results for the supplementary frequencies

(coordinates, cos2)

partial.axes a list of matrices containing all the results for the partial axes (coordinates, cor-

relation between variables and axes, correlation between partial axes)

MFA 41

global.pca the result of the analysis when it is considered as a unique weighted PCA

Returns the individuals factor map, the variables factor map and the groups factor map. The plots may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the plot.MFA function.

mortality

The cause of mortality in France in 1979 and 2006

## **Description**

The cause of mortality in France in 1979 and 2006.

## Usage

```
data(mortality)
```

PCA 43

## **Format**

A data frame with 62 rows (the different causes of death) and 18 columns. Each column corresponds to an age interval (15-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, 85-94, 95 and more) in a year. The 9 first columns correspond to data in 1979 and the 9 last columns to data in 2006. In each cell, the counts of deaths for a cause of death in an age interval (in a year) is given.

### **Source**

Centre d'epidemiologie sur les causes medicales

## **Examples**

PCA

Principal Component Analysis (PCA)

## Description

Performs Principal Component Analysis (PCA) with supplementary individuals, supplementary quantitative variables and supplementary categorical variables.

Missing values are replaced by the column mean.

## Usage

```
PCA(X, scale.unit = TRUE, ncp = 5, ind.sup = NULL,
   quanti.sup = NULL, quali.sup = NULL, row.w = NULL,
   col.w = NULL, graph = TRUE, axes = c(1,2))
```

Χ	a data frame with $n$ rows (individuals) and $p$ columns (numeric variables)
ncp	number of dimensions kept in the results (by default 5)
scale.unit	a boolean, if TRUE (value set by default) then data are scaled to unit variance
ind.sup	a vector indicating the indexes of the supplementary individuals
quanti.sup	a vector indicating the indexes of the quantitative supplementary variables

44 PCA

quali.sup	a vector indicating the indexes of the categorical supplementary variables
row.w	an optional row weights (by default, a vector of 1 for uniform row weights); the weights are given only for the active individuals
col.w	an optional column weights (by default, uniform column weights); the weights are given only for the active variables
graph	boolean, if TRUE a graph is displayed
axes	a length 2 vector specifying the components to plot

## Value

# Returns a list including:

eig	a matrix containing all the eigenvalues, the percentage of variance and the cu- mulative percentage of variance
var	a list of matrices containing all the results for the active variables (coordinates, correlation between variables and axes, square cosine, contributions)
ind	a list of matrices containing all the results for the active individuals (coordinates, square cosine, contributions)
ind.sup	a list of matrices containing all the results for the supplementary individuals (coordinates, square cosine)
quanti.sup	a list of matrices containing all the results for the supplementary quantitative variables (coordinates, correlation between variables and axes)
quali.sup	a list of matrices containing all the results for the supplementary categorical variables (coordinates of each categories of each variables, v.test which is a criterion with a Normal distribution, and eta2 which is the square correlation corefficient between a qualitative variable and a dimension)

Returns the individuals factor map and the variables factor map.

The plots may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the plot. PCA function.

plot.CA

Draw the Correspondence Analysis (CA) graphs

## **Description**

Draw the Correspondence Analysis (CA) graphs.

## Usage

```
## S3 method for class 'CA'
plot(x, axes = c(1, 2),
        xlim = NULL, ylim = NULL,
invisible = c("none","row","col","row.sup","col.sup","quali.sup"),
choix = c("CA","quanti.sup"), col.row="blue", col.col="red",
col.row.sup="darkblue", col.col.sup="darkred",
        col.quali.sup="magenta", col.quanti.sup="blue",
label = c("all","none","row","row.sup","col","col.sup","quali.sup","quanti.sup"),
        title = NULL, palette = NULL, autoLab = c("auto","yes","no"),
new.plot=FALSE, selectRow = NULL, selectCol = NULL,
unselect = 0.7, shadowtext = FALSE, habillage = "none",
legend = list(bty = "y", x = "topleft"),
graph.type = c("ggplot","classic"), ggoptions = NULL, ...)
```

46 plot.CA

х	an object of class CA
axes	a length 2 vector specifying the components to plot
xlim	range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim	range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
invisible	string indicating if some points should be unlabelled ("row", "col", "row.sup", "col.sup", "quali.sup")
choix	the graph to plot ("CA" for the CA map, "quanti.sup" for the supplementary quantitative variables)
col.row	a color for the rows points
col.col	a color for columns points
col.row.sup	a color for the supplementary rows points
col.col.sup	a color for supplementary columns points
col.quali.sup	a color for the supplementary categorical variables
col.quanti.sup	a color for the supplementary quantitative variables
label	a list of character for the elements which are labelled (by default, all the elements are labelled ("row", "row.sup", "col", "col.sup", "quali.sup", "quanti.sup")
title	string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
palette	the color palette used to draw the points. By default colors are chosen. If you want to define the colors: palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=25))).
autoLab	if autoLab="auto", autoLab is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap
new.plot	boolean, if TRUE, a new graphical device is created
selectRow	a selection of the rows that are drawn; see the details section
selectCol	a selection of the columns that are drawn; see the details section
unselect	may be either a value between 0 and 1 that gives the transparency of the unselected objects (if unselect=1 the transparceny is total and the elements are not drawn, if unselect=0 the elements are drawn as usual but without any label) or may be a color (for example unselect="grey60")
shadowtext	boolean; if true put a shadow on the labels (rectangles are written under the labels which may lead to difficulties to modify the graph with another program)
habillage	color the individuals among a categorical variable (give the number of the categorical supplementary variable or its name)
legend	a list of arguments that defines the legend if needed (when individuals are drawn according to a variable); see the arguments of the function legend
graph.type	a character that gives the type of graph used: "ggplot" or "classic"
ggoptions	a list that gives the graph options when grah.type="ggplot" is used. See the optines and the default values in the details section
• • •	further arguments passed to or from other methods, such as cex, cex.main,

plot.CA 47

### **Details**

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example cex=0.7.

The selectRow and selectCol arguments can be used in order to select a part of the elements that are drawn. For example, you can use:

selectRow = 1:5 and then the rows 1 to 5 are drawn.

select = c("name1","name5") and then the rows that have the names name1 and name5 are drawn.

select = "coord 10" and then the 10 rows (10 active and 10 supplementaries) that have the highest (squared) coordinates on the 2 chosen dimensions are drawn.

select = "contrib 10" and then the 10 rows (10 active) that have the highest contribution on the 2 dimensions of your plot are drawn.

select = "cos2 5" and then the 5 rows (5 actives and 5 supplementaries) that have the highest cos2 on the 2 dimensions of your plot are drawn.

select = "dist 8" and then the 8 rows (8 actives and 8 supplementaries) that have the highest distance to the center of gravity are drawn.

#### Value

Returns the factor map with the joint plot of CA.

48 plot.CaGalt

cal Table (CaGalt) graphs	plot.CaGalt	Draw the Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt) graphs
---------------------------	-------------	--

# Description

Plot the graphs for a Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt).

# Usage

```
## S3 method for class 'CaGalt'
plot(x, axes = c(1, 2), choix = c("ind", "freq", "quali.var", "quanti.var"),
  conf.ellip = FALSE, contr.ellipse = 3, xlim = NULL, ylim = NULL, col.ind = "black",
  col.freq = "darkred", col.quali = "blue", col.quanti = "blue", label = TRUE,
  lim.cos2.var = 0, title = NULL, palette = NULL,
  autoLab = c("auto", "yes", "no"), new.plot = FALSE, select = NULL,
  unselect = 0.7, shadowtext = FALSE, ...)
```

X	an object of class CaGalt
axes	a length 2 vector specifying the components to plot
choix	the graph to plot ("ind" for the individuals, "freq" for the frequencies, "quali.var" for the categorical variables, "quanti.var" for the quantitative variables)
conf.ellip	boolean (FALSE by default), if TRUE, draw ellipses around the frequencies and the variables
contr.ellipse	the confidence ellipses were drawn for the frequencies with a contribution higher than X times of mean contribution on the 2 dimensions of your plot (by default 3)
xlim	range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim	range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
col.ind	a color for the individuals (by default "black")
col.freq	a color for the frequencies (by default "darkred")
col.quali	a color for the categories of categorical variables (by default "blue")
col.quanti	a color for the quantitative variables (by default "blue")
label	the labels are drawn (by default TRUE)
lim.cos2.var	value of the square cosinus under the variables are not drawn
title	string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
palette	the color palette used to draw the points. By default colors are chosen. If you want to define the colors: palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=25))).

plot.CaGalt 49

autoLab	if autoLab="auto", autoLab is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap
new.plot	boolean, if TRUE, a new graphical device is created
select	a selection of the elements that are drawn; see the details section
unselect	may be either a value between 0 and 1 that gives the transparency of the unselected objects (if unselect=1 the transparency is total and the elements are not drawn, if unselect=0 the elements are drawn as usual but without any label) or may be a color (for example unselect="grey60")
shadowtext	boolean; if true put a shadow on the labels (rectangles are written under the labels which may lead to difficulties to modify the graph with another program)
	further arguments passed to or from other methods, such as cex, cex.main,

### **Details**

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example cex=0.7. The select argument can be used in order to select a part of the elements (individuals if you draw the graph of individuals, or variables if you draw the graph of variabless) that are drawn. For example, you can use: select = 1:5 and then the elements 1:5 are drawn. select = c("name1", "name5") and then the elements that have the names name1 and name5 are drawn. select = "coord 10" and then the 10 elements that have the highest (squared) coordinates on the 2 chosen dimensions are drawn. select = "contrib 10" and then the 10 elements that have the highest contribution on the 2 dimensions of your plot are drawn (available only when frequencies are drawn). select = "cos2 5" and then the 5 elements that have the highest cos2 on the 2 dimensions of your plot are drawn.

### Value

Returns the individuals, the frequencies and the variables factor map.

plot(res.cagalt,choix="freq",col.freq="darkgreen",cex=1.5,select="contrib 10")</pre>
```

50 plot.catdes

```
plot(res.cagalt,choix="ind",select="coord 10")
plot(res.cagalt,choix="quali.var",select="cos2 0.5")
## End(Not run)
```

plot.catdes

Plots for description of clusters (catdes)

# Description

Plots a graph from a catdes output.

# Usage

```
## S3 method for class 'catdes'
plot(x, show="all",output=c("figure","dt") , level=0.01, sort=NULL,
    col.upper="indianred2", col.lower="royalblue1", numchar = 10,
    barplot = FALSE,cex.names=1, ...)
```

x	A catdes object, see catdes for details.
show	a string. If "quali", only the categorical variables are used. If "quanti", only the the quantitative variables are used. If "all", both quali and quanti are used. If "quanti.var" is used the characterization of the quantitative variables is given; if "test.chi2" is used the characterization of the qualitative variables is given.
output	string: "dt" for a datatable or "figure" for a figure
level	a positive float. Indicates a critical value the p-value.
sort	NULL (default) or an integer between 1 and the number of clusters or a character (the name of a group). If it is an integer or the name of a group, the features are sorted according to their significances in the construction of the given cluster.
col.upper	The color used for under-represented features.
col.lower	The color used for over-represented features.
numchar	number of characters for the labels
barplot	a boolean; if true a barplot per category is drawn, else a table
cex.names	the magnification to be used for the names
	further arguments passed to or from other methods

plot.DMFA 51

### Value

if barplot is true, a barplot is drawn per category with variables that significantly describe the category.

If barplot is false; it returns a grid. The rows stand for the clusters and the columns for the significant variables. A cell colored in col.lower (resp. col.upper) i.e. by default in blue (resp. red) for a quantitative variable means that the average value of the variable in the given cluster is significantly lower (resp. higher) than in the overall data. A cell colored in col.lower (resp. col.upper) for a categorical variable means that the given value of the variable is significantly under-represented (resp. over-represented) in the given cluster than in the overall data. The degree of transparency of the color also indicates the significance of the difference between the behavior of the variable in the given cluster and in the overall data. Indeed, the more transparent the cell is, the less significant the difference is.

graph.type = c("ggplot","classic"), ggoptions = NULL, ...)
```

x	an object of class FAMD
choix	a string corresponding to the graph that you want to do ("ind" for the individual or categorical variables graph, "var" for all the variables (quantitative and categorical), "quanti" for the correlation circle)
axes	a length 2 vector specifying the components to plot
lab.var	boolean indicating if the labelled of the variables should be drawn on the map
lab.ind	boolean indicating if the labelled of the individuals should be drawn on the map
habillage	string corresponding to the color which are used. If "ind", one color is used for each individual else if it is the name or the position of a categorical variable, it colors according to the different categories of this variable
col.lab	boolean indicating if the labelled should be colored
col.hab	vector indicating the colors to use to labelled the rows or columns elements chosen in habillage
invisible	list of string; for choix ="ind", the individuals can be omit (invisible = "ind"), or supplementary individuals (invisible="ind.sup") or the centerg of gravity of the categorical variables (invisible= "quali"); if invisible = c("ind","ind.sup"), just the centers of gravity are drawn
lim.cos2.var	value of the square cosinus under the variables are not drawn
xlim	range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim	range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
title	string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
palette	the color palette used to draw the points. By default colors are chosen. If you want to define the colors: palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=25))).
autoLab	if autoLab="auto", autoLab is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap
new.plot	boolean, if TRUE, a new graphical device is created
select	a selection of the elements that are drawn; see the details section

54 plot.GPA

unselect	may be either a value between 0 and 1 that gives the transparency of the unselected objects (if unselect=1 the transparceny is total and the elements are not drawn, if unselect=0 the elements are drawn as usual but without any label) or may be a color (for example unselect="grey60")
shadowtext	boolean; if true put a shadow on the labels (rectangles are written under the labels which may lead to difficulties to modify the graph with another program)
legend	a list of arguments that defines the legend if needed (when individuals are drawn according to a variable); see the arguments of the function legend
graph.type	a character that gives the type of graph used: "ggplot" or "classic"
ggoptions	a list that gives the graph options when grah.type="ggplot" is used. See the optines and the default values in the details section
	further arguments passed to or from other methods, such as cex, cex.main,

## Value

Returns the individuals factor map and the variables factor map.

 $\mathsf{GPA}$ 

plot.HCPC	Plots for Hierarchical Classification on Principle Components (HCPC) results

# Description

Plots graphs from a HCPC result: tree, barplot of inertia gains and first factor map with or without the tree, in 2 or 3 dimensions.

56 plot.HCPC

## Usage

```
## S3 method for class 'HCPC'
plot(x, axes=c(1,2), choice="3D.map", rect=TRUE,
   draw.tree=TRUE, ind.names=TRUE, t.level="all", title=NULL,
   new.plot=FALSE, max.plot=15, tree.barplot=TRUE,
   centers.plot=FALSE, ...)
```

## **Arguments**

x A HCPC object, see HCPC for details.

axes a two integers vector. Defines the axes of the factor map to plot.

choice A string. "tree" plots the tree. "bar" plots bars of inertia gains. "map" plots a

factor map, individuals colored by cluster. "3D.map" plots the same factor map,

individuals colored by cluster, the tree above.

rect a boolean. If TRUE, rectangles are drawn around clusters if choice ="tree".

tree.barplot a boolean. If TRUE, the barplot of intra inertia losses is added on the tree graph.

A boolean. If TRUE, the tree is projected on the factor map if choice ="map".

A boolean. If TRUE, the individuals names are added on the factor map when

choice="3D.map" or choice="map"

t.level Either a positive integer or a string. A positive integer indicates the starting

level to plot the tree on the map when draw.tree=TRUE. If "all", the whole tree

is ploted. If "centers", it draws the tree starting t the centers of the clusters.

title a string. Title of the graph. NULL by default and a title is automatically defined centers.plot a boolean. If TRUE, the centers of clusters are drawn on the 3D factor maps.

new.plot a boolean. If TRUE, the plot is done in a new window.

max.plot The max for the bar plot

... Other arguments from other methods.

### Value

Returns the chosen plot.

    invisible = NULL, lim.cos2.var = 0.,
    xlim = NULL, ylim = NULL, cex = 1, title = NULL, new.plot = FALSE, ...)
```

## **Arguments**

Χ	an object of class HMFA
axes	a length 2 vector specifying the components to plot
num	number of grpahs in a same windows
choix	a string corresponding to the graph that you want to do ("ind" for the individual or categorical variables graph, "var" for the quantitative variables graph, "axes" for the graph of the partial axes, "group" for the groups representation)
lab.grpe	boolean, if TRUE, the label of the groups are drawn
lab.var	boolean, if TRUE, the label of the variables are drawn
lab.ind.moy	boolean, if TRUE, the label of the mean points are drawn
invisible	list of string; for choix ="ind", the individuals can be omit (invisible = "ind"), or the centers of gravity of the categorical variables (invisible= "quali")
lim.cos2.var	value of the square cosinus under with the points are not drawn
xlim	range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim	range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
cex	cf. function par in the <b>graphics</b> package
title	string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
new.plot	boolean, if TRUE, a new graphical device is created
	further arguments passed to or from other methods

## Value

shadowtext	boolean; if true put a shadow on the labels (rectangles are written under the labels which may lead to difficulties to modify the graph with another program)
legend	a list of arguments that defines the legend if needed (when individuals are drawn according to a variable); see the arguments of the function legend
graph.type	a character that gives the type of graph used: "ggplot" or "classic"
ggoptions	a list that gives the graph options when grah.type="ggplot" is used. See the optines and the default values in the details section
	further arguments passed to or from other methods, such as cex, cex.main,

# **Details**

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example

60 plot.MCA

```
cex=0.7.
```

The select argument can be used in order to select a part of the elements (individuals if you draw the graph of individuals, or variables if you draw the graph of variabless) that are drawn. For example, you can use:

select = 1:5 and then the elements 1:5 are drawn.

select = c("name1", "name5") and then the elements that have the names name1 and name5 are drawn.

select = "coord 10" and then the 10 elements that have the highest (squared) coordinates on the 2 chosen dimensions are drawn.

select = "contrib 10" and then the 10 elements that have the highest contribution on the 2 dimensions of your plot are drawn.

select = "cos2 5" and then the 5 elements that have the highest cos2 on the 2 dimensions of your plot are drawn.

select = "dist 8" and then the 8 elements that have the highest distance to the center of gravity are drawn

The selectMod argument can be used in order to select the categories that are drawn.

### Value

Returns the individuals factor map and the variables factor map.

## **Details**

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example cex=0.7.

The select argument can be used in order to select a part of the elements (individuals if you draw the graph of individuals, or variables if you draw the graph of variabless) that are drawn. For example, you can use:

select = 1:5 and then the elements 1:5 are drawn.

select = c("name1", "name5") and then the elements that have the names name1 and name5 are drawn.

64 plot.MFA

select = "coord 10" and then the 10 elements (individuals, variables, frequencies) that have the highest (squared) coordinates on the 2 chosen dimensions are drawn.

select = "contrib 10" and then the 10 elements (individuals, variables, frequencies) that have the highest contribution on the 2 dimensions of your plot are drawn.

select = "cos2 5" and then the 5 elements (individuals, variables, frequencies) that have the highest cos2 on the 2 dimensions of your plot are drawn.

selectMod = "contrib 5", the 5 categories that contribute the most to the two dimensions are drawn.

selectMod = "cos2 0.5", the categories that have a cos2 greater than 0.5 on the two dimensions are drawn.

selectMod = "v. test 2", the categories that have a v.test higher than the value on one of the two dimensions are drawn.

### Value

Returns the individuals factor map and the variables factor map.

plot.PCA 67

### **Details**

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example cex=0.7.

The select argument can be used in order to select a part of the elements (individuals if you draw the graph of individuals, or variables if you draw the graph of variables) that are drawn. For example, you can use:

select = 1:5 and then the elements 1:5 are drawn.

select = c("name1", "name5") and then the elements that have the names name1 and name5 are drawn.

select = "coord 10" and then the 10 elements that have the highest (squared) coordinates on the 2 chosen dimensions are drawn.

select = "contrib 10" and then the 10 elements that have the highest contribution on the 2 dimensions of your plot are drawn.

select = "cos2 5" and then the 5 elements that have the highest cos2 on the 2 dimensions of your plot are drawn.

select = "dist 8" and then the 8 elements that have the highest distance to the center of gravity are drawn.

ggoptions is a list that gives some ggplot2 options when the graph.type="ggplot" is used. Use for instance ggoptions(list(size=3,title.size=10,bg.color="orange")) if you want to modify the size of the points and labels, the title size and the background color.

Below you can see the options and the default values:

```
size = 4, #label size (point size = size/3)
```

point.shape = 19, #points shape

line.lty = 2, #origin linetypes (0="blank", 1="solid", 2="dashed", 3="dotted",...)

line.lwd = 0, #origin lines width

line.color = "black", #origin lines color

segment.lty = 1, #arrow linetypes (0="blank", 1="solid", 2="dashed", 3="dotted",...)

segment.lwd = 0, #arrow width

circle.lty = 1, #circle linetypes (0="blank", 1="solid", 2="dashed", 3="dotted",...)

circle.lwd = 0, #circle width

circle.color = "black", #circle color

low.col.quanti = "blue", #for quantitative variables, low color to be used

high.col.quanti = "red3", #for quantitative variables, high color to be used

# Value

Returns the individuals factor map and the variables factor map.

## To draw classical R graphs
plot(res.pca, graph.type = "classic")
## End(Not run)
```

plotellipses

Draw confidence ellipses around the categories

### **Description**

Draw confidence ellipses around the categories.

# Usage

```
plotellipses(model, keepvar = "all", axes = c(1, 2), means=TRUE, level = 0.95,
    magnify = 2, cex = 1, pch = 20, pch.means=15, type = c("g","p"),
    keepnames = TRUE, namescat = NULL, xlim=NULL, ylim=NULL, lwd=1,
    label="all", autoLab=c("auto","yes","no"),
graph.type = c("ggplot","classic"), ...)
```

plotellipses 69

### **Arguments**

model an object of class MCA or PCA or MFA

keepvar a boolean or numeric vector of indexes of variables or a character vector of

names of variables. If keepvar is "all", "quali" or "quali.sup" variables which are plotted are all the categorical variables, only those which are used to compute the dimensions (active variables) or only the supplementary categorical variables. If keepvar is a numeric vector of indexes or a character vector of names

of variables, only relevant variables are plotted.

axes a length 2 vector specifying the components to plot

means boolean which indicates if the confidence ellipses are for (the coordinates of)

the means of the categories (the empirical variance is divided by the number of

observations) or for (the coordinates of) the observations of the categories

level the confidence level for the ellipses

magnify numeric which control how the level names are magnified. A value of 2 means

that the level names have character expansion equal to two times cex

cex cf. function par in the **graphics** package

pch plotting character for coordinates, cf. function par in the **graphics** package pch.means plotting character for means, cf. function par in the **graphics** package

type cf. function xyplot in the **lattice** package

keepnames a boolean or numeric vector of indexes of variables or a character vector of

names of variables. If keepnames is TRUE, names of levels are taken from the (modified) dataset extracted from modele, if FALSE trimming names is done. When trimming, names of levels are taken from the (modified) dataset extracted from modele, then, the corresponding number of characters of names of original variables plus 1 is removed. If keepnames is a vector of indexes or names,

trimming is done on all variables excepted whose in keepnames

namescat a vector giving for each observation the value of categorical variable, each vari-

able are stacked under each other. If NULL, names are taken from the (modified)

dataset extracted from modele

range for the plotted 'x' values, defaulting to the range of the finite values of 'x' range for the plotted 'y' values, defaulting to the range of the finite values of 'y'

1wd The line width, a positive number, defaulting to 1

label a list of character for the elements which are labelled (by default, "all", you can

use "none", "ind", ind.sup"))

autoLab if autoLab="auto", autoLab is equal to "y" if there are less than 50 elements

and "no" otherwise; if "y", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements

are placed quickly but may overlap

graph.type a character that gives the type of graph used: "ggplot" or "classic"

... further arguments passed to or from other methods

## Value

Return a graph with the ellipses. If only one variable is chosen, the graph is different.

plotGPApartial

Draw an interactive General Procrustes Analysis (GPA) map

## **Description**

Draw an interactive General Procrustes Analysis (GPA) map. The graph is interactive and clicking on a point will draw the partial points, if you click on a point for which the partial points are yet drawn, the partial points are deleted. To stop the interactive plot, click on the title (or in the top of the graph)

## Usage

```
plotGPApartial(x, axes = c(1, 2),
    lab.ind.moy = TRUE, habillage = "ind",
    chrono = FALSE, draw.partial = NULL,
    xlim = NULL, ylim = NULL, cex = 1, title = NULL, palette = NULL, ...)
```

X	an object of class GPA
axes	a length 2 vector specifying the components to plot
lab.ind.moy	boolean, if TRUE, the label of the mean points are drawn
habillage	string corresponding to the color which are used. If "ind", one color is used for each individual; if "group" the individuals are colored according to the group
chrono	boolean, if TRUE, the partial points of a same point are linked (useful when groups correspond to different moment)

plotMFApartial 71

draw.partial	data frame of a boolean variable for all the individuals and all the centers of gravity and with for which the partial points should be drawn (by default, NULL and no partial points are drawn)
xlim	range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim	range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
cex	cf. function par in the <b>graphics</b> package
title	string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
palette	the color palette used to draw the points. By default colors are chosen. If you want to define the colors: palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=25))).
	further arguments passed to or from other methods

## Value

Returns the General Procrustes Analysis map.

   draw.partial = NULL, xlim = NULL, ylim = NULL,
   cex = 1, title = NULL, palette = NULL, ...)
```

72 plotMFApartial

## **Arguments**

X	an object of class MFA
axes	a length 2 vector specifying the components to plot
lab.ind	boolean, if TRUE, the label of the mean points are drawn
lab.par	boolean, if TRUE, the label of the partial points are drawn
habillage	string corresponding to the color which are used. If "group", one color is used for each group of variables; if "quali" the individuals are colored according to one categorical variable; if "group" the individuals are colored according to the group
chrono	boolean, if TRUE, the partial points of a same point are linked (useful when groups correspond to different moment)
col.hab	the colors to use. By default, colors are chosen
invisible	list of string; for choix ="ind", the individuals can be omit (invisible = "ind"), or supplementary individuals (invisible="ind.sup") or the centerg of gravity of the categorical variables (invisible= "quali"); if invisible = c("ind", "ind.sup"), just the centers of gravity are drawn
draw.partial	data frame of a boolean variable for all the individuals and all the centers of gravity and with for which the partial points should be drawn (by default, NULL and no partial points are drawn)
xlim	range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim	range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
cex	cf. function par in the <b>graphics</b> package
title	string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
palette	the color palette used to draw the points. By default colors are chosen. If you want to define the colors: palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=2))).
	further arguments passed to or from other methods

## Value

prefpls 79

prefpls	Scatter plot and additional variables with quality of representation contour lines

# Description

This function is useful to interpret the usual graphs (x,y) with additional quantitative variables.

### Usage

```
prefpls(donnee, var1 = 1, var2 = 2, firstvar = 3,
    lastvar = ncol(donnee), levels = c(0.2,0.4,0.6,0.7,0.8,0.9,1),
    asp = 1, nbchar = max(nchar(colnames(donnee))), title = NULL,
    choix="var")
```

### **Arguments**

donnee	a data frame made up of quantitative variables
var1	the position of the variable corresponding to the x-axis
var2	the position of the variable corresponding to the y-axis
firstvar	the position of the first endogenous variable
lastvar	the position of the last endogenous variable (by default the last column of donnee)
levels	a list of the levels displayed in the graph of variables
asp	aspect ratio for the graph of the individuals
nbchar	the number of characters used for the labels of the variables
title	string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
choix	the graph to plot ("ind" for the individuals, "var" for the variables)

### **Details**

This function is very useful when there is a strong correlation between two variables x and y

# Value

A scatter plot of the invividuals

A graph with additional variables and the quality of representation contour lines.

print.PCA 89

n	ri	nt	Р	C A
D	ıΤ	ΠL	. г	CA

Print the Principal Component Analysis (PCA) results

### **Description**

Print the Principal Component Analysis (PCA) results.

### Usage

```
## S3 method for class 'PCA'
print(x, file = NULL, sep = ";", ...)
```

# Arguments

Х	an object of class PCA
file	A connection, or a character string naming the file to print to. If NULL (the default), the results are not printed in a file
sep	character string to insert between the objects to print (if the argument file is not NULL
	further arguments passed to or from other methods

# Author(s)

Jeremy Mazet, Francois Husson <francois.husson@institut-agro.fr>

```

```
## Not run:
data(decathlon)
res.pca <- PCA(decathlon, quanti.sup = 11:12, quali.sup = 13)
print(res.pca, file="c:/essai.csv", sep = ";")
## End(Not run)</pre>
```

90 reconst

reconst

Reconstruction of the data from the PCA, CA or MFA results

# Description

Reconstruct the data from the PCA, CA or MFA results.

# Usage

```
reconst(res, ncp=NULL)
```

### **Arguments**

res an object of class PCA, CA or MFA

ncp number of dimensions used to reconstitute the data (by default NULL and the

number of dimensions calculated for the PCA, CA or MFA is used)

#### Value

Returns a data frame with the number of individuals and the number of variables used for the PCA, CA or MFA

### Author(s)

Francois Husson francois.husson@institut-agro.fr>, Julie JosseJulie.Josse@agrocampus-ouest.fr>

# See Also

```

RegBest 91

RegBest Select variables in multiple linear regression	
--	--

# Description

Find an optimal submodel

# Usage

```
RegBest(y,x, int = TRUE, wt=NULL, na.action = na.omit,
    method=c("r2","Cp", "adjr2"), nbest=1)
```

# Arguments

у	A response vector
X	A matrix of predictors
int	Add an intercept to the model
wt	Optional weight vector
na.action	Handling missing values
method	Calculate R-squared, adjusted R-squared or Cp to select the model. By default a the F-test on the r-square is used
nbest	number of best models for each set of explained variables (by default 1)

### Value

Returns the objects

all gives all the nbest best models for a given number of variables

best the best model

### Author(s)

Francois Husson <francois.husson@institut-agro.fr>

# See Also

res = RegBest(y=milk[,6],x=milk[,-6])
res$best
```

92 simule

senso senso

#### **Description**

Dataset to illustrate one-way and Two-way analysis of variance

#### Usage

```
data(senso)
```

#### **Format**

Dataset with 45 rows and 3 columns: Score, Product and Day

# **Examples**

```
## Example of 2-way analysis of variance
data(senso)
res <- AovSum (Score~ Product + Day, data=senso)
res

## Example of 2-way analysis of variance with interaction
data(senso)
res2 <- AovSum (Score~ Product + Day + Product : Day, data=senso)
res2</pre>
```

simule

Simulate by bootstrap

### **Description**

Simulate by bootstrap

# Usage

```
simule(data, nb.simul)
```

#### **Arguments**

data

A data frame from which the rows are the original data from which the simualte data are calculated (by the average of a bootstrap sample. The columns corresponds to the variables for which the simulation should be done. The first column must be a factor allowing to group the rows. A bootstrap simulation is

done for each level of this factor.

nb.simul

The number of simulations.

summary.CA 93

#### **Details**

The simulation is independently done for each level of the factor. The number of rows can be different for each levels.

#### Value

mean Data.frame with all the levels of the factor variable, and for each variable, the

mean of the original data.

simul Data.frame with all the levels of the factor variable, and for each variable, the

nb.simul bootstrap simulations.

simul.mean Data.frame with all the levels of the factor variable, and for each variable, the

mean of the simulated data.

Jeremy Mazet

summary.CA Printing summeries of ca objects

### **Description**

Printing summaries of correspondence analysis objects

### Usage

```
## S3 method for class 'CA'
summary(object, nb.dec = 3, nbelements=10,
    ncp = 3, align.names=TRUE, file="", ...)
```

### **Arguments**

object an object of class CA
nb.dec number of decimal printed

nbelements number of elements written (rows, columns, ...); use nbelements = Inf if you

want to have all the elements

ncp number of dimensions printed

align.names boolean, if TRUE the names of the objects are written using the same number

of characters

file a connection, or a character string naming the file to print to

... further arguments passed to or from other methods, such as cex, cex.main, ...

# Author(s)

summary.CaGalt	Printing summaries of CaGalt objects

#### **Description**

Printing summaries of Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt) objects

### Usage

```
## S3 method for class 'CaGalt'
summary(object, nb.dec = 3, nbelements=10, nbind = nbelements,
ncp = 3, align.names=TRUE, file="", ...)
```

### **Arguments**

nbind

object an object of class CaGalt

nb.dec number of printed decimals

number of written elements (variables, categories, frequencies); use nbelements

= Inf if you want to have all the elements

number of written elements; use nbind = Inf to have the results for all the indi-

viduals and nbind = 0 if you do not want the results for individuals

ncp number of printed dimensions

align.names boolean, if TRUE the names of the objects are written using the same number

of characters

file a connection, or a character string naming the file to print to

... further arguments passed to or from other methods, such as cex, cex.main, ...

svd.triplet 99

svd.triplet	Singular Value Decomposition of a Matrix
-------------	--

# Description

Compute the singular-value decomposition of a rectangular matrix with weights for rows and columns.

### Usage

```
svd.triplet(X, row.w=NULL, col.w=NULL, ncp=Inf)
```

### **Arguments**

Χ	a data matrix
row.w	vector with the weights of each row (NULL by default and the weights are uniform)
col.w	vector with the weights of each column (NULL by default and the weights are uniform)
ncp	the number of components kept for the outputs

#### Value

vs a vector containing the singular values of 'x';

u a matrix whose columns contain the left singular vectors of 'x'; v a matrix whose columns contain the right singular vectors of 'x'.

#### See Also

svd

|--|

# Description

Make a disjonctif table.

# Usage

```
tab.disjonctif(tab)
```

# Arguments

tab a data frame with factors

100 tea

#### Value

The disjonctif table

tab.disjonctif.prop

Make a disjunctive table when missing values are present

#### **Description**

Create a disjunctive table. The missing values are replaced by the proportion of the category.

#### Usage

```
tab.disjonctif.prop(tab,seed=NULL,row.w=NULL)
```

### **Arguments**

tab a data frame with factors

row.w an optional row weights (by default, a vector of 1 for uniform row weights)

seed a single value, interpreted as an integer for the set.seed function (if seed =

NULL, missing values are initially imputed by the mean of each variable)

#### Value

The disjonctif table.prop

tea	tea	(data)
cca	icu	cicirci,

### **Description**

The data used here concern a questionnaire on tea. We asked to 300 individuals how they drink tea (18 questions), what are their product's perception (12 questions) and some personal details (4 questions).

### Usage

data(tea)

#### **Format**

A data frame with 300 rows and 36 columns. Rows represent the individuals, columns represent the different questions. The first 18 questions are active ones, the 19th is a supplementary quantitative variable (the age) and the last variables are supplementary categorical variables.

textual 101

#### **Examples**

```
## Not run:
data(tea)
res.mca=MCA(tea,quanti.sup=19,quali.sup=20:36)
plot(res.mca,invisible=c("var","quali.sup","quanti.sup"),cex=0.7)
plot(res.mca,invisible=c("ind","quali.sup","quanti.sup"),cex=0.8)
plot(res.mca,invisible=c("quali.sup","quanti.sup"),cex=0.8)
dimdesc(res.mca)
plotellipses(res.mca,keepvar=1:4)
## make a hierarchical clustering: click on the tree to define the number of clusters
## HCPC(res.mca)
## End(Not run)
```

textual

Text mining

#### **Description**

Calculates the number of occurence of each words and a contingence table

#### Usage

```
textual(tab, num.text, contingence.by=1:ncol(tab),
    maj.in.min = TRUE, sep.word=NULL)
```

#### **Arguments**

tab a data frame with one textual variable

num. text indice of the textual variable

contingence by a list with the indices of the variables for which a contingence table is calculated

by default a contingence table is calculated for all the variables (except the textual one). A contingence table can also be calculated for couple of variables. If contingence by is equal to num.text, then the contingence table is calculated

for each row of the data table

maj.in.min boolean, if TRUE majuscule are transformed in minuscule

sep. word a string with all the characters which correspond to separator of words

#### Value

Returns a list including:

cont.table the contingence table with in rows the categories of the categorical variables (or

the couple of categories), and in column the words, and in each cell the number

of occurence

nb. words a data frame with all the words and for each word, the number of lists in which

it is present, and the number of occurence

102 wine

    num.group.sup=c(1,6),graph=FALSE)
plotellipses(res.mfa)
plotellipses(res.mfa,keepvar="Label") ## for 1 variable
## End(Not run)
```

write.infile

Print in a file

# Description

Print in a file.

### Usage

```
write.infile(X, file, sep=";", append = FALSE, nb.dec=4)
```

### **Arguments**

Χ	an object of class list, data.frame, matrix,
file	A connection, or a character string naming the file to print to
sep	character string to insert between the objects to print (if the argument file is not NULL)
append	logical. If TRUE output will be appended to file; otherwise, it will overwrite the contents of file.
nb.dec	number of decimal printed, by default 4

### Author(s)

Francois Husson <francois.husson@institut-agro.fr>

```
