Imports methods

Suggests knitr, rmarkdown, testthat, Matrix, covr, slam

Description R interface to the Embedded COnic Solver (ECOS), an efficient
and robust C library for convex problems. Conic and equality
constraints can be specified in addition to integer and
boolean variable constraints for mixed-integer problems. This
R interface is inspired by the python interface and has
similar calling conventions.

ecos.control	*Return the default optimization parameters for ECOS*

Description

This is used to control the behavior of the underlying optimization code.

Usage

```
ecos.control(
  maxit = 100L,
  feastol = 1e-08,
  reltol = 1e-08,
  abstol = 1e-08,
  feastol_inacc = 1e-04,
  abstol_inacc = 5e-05,
  reltol_inacc = 5e-05,
  verbose = 0L,
  mi_max_iters = 1000L,
  mi_int_tol = 1e-04,
  mi_abs_eps = 1e-06,
  mi_rel_eps = 1e-06
)
```

Arguments

maxit	the maximum number of iterations for ecos, default 100L
feastol	the tolerance on the primal and dual residual, default 1e-8
reltol	the relative tolerance on the duality gap, default 1e-8
abstol	the absolute tolerance on the duality gap, default 1e-8
feastol_inacc	the tolerance on the primal and dual residual if reduced precisions, default 1e-4
abstol_inacc	the absolute tolerance on the duality gap if reduced precision, default 5e-5
reltol_inacc	the relative tolerance on the duality gap if reduced precision, default 5e-5
verbose	verbosity level, default 0L. A verbosity level of 1L will show more detail, but clutter session transcript.
mi_max_iters	the maximum number of branch and bound iterations (mixed integer problems only), default 1000L

`mi_int_tol`	the integer tolerence (mixed integer problems only), default 1e-4
`mi_abs_eps`	the absolute tolerance between upper and lower bounds (mixed integer problems only), default 1e-6
`mi_rel_eps`	the relative tolerance, $(U - L)/L$, between upper and lower bounds (mixed integer problems only), default 1e-6

Value

a list with the following elements:

FEASTOL the tolerance on the primal and dual residual, parameter `feastol`

ABSTOL the absolute tolerance on the duality gap, parameter `abstol`

RELTOL the relative tolerance on the duality gap, parameter `reltol`

FEASTOL_INACC the tolerance on the primal and dual residual if reduced precisions, parameter `feastol_inacc`

ABSTOL_INACC the absolute tolerance on the duality gap if reduced precision, parameter `abstol_inacc`

RELTOL_INACC the relative tolerance on the duality gap if reduced precision, parameter `reltol_inacc`

MAXIT the maximum number of iterations for ecos, parameter `maxit`

MI_MAX_ITERS the maximum number of branch and bound iterations (mixed integer problems only), parameter `mi_max_iters`

MI_INT_TOL the integer tolerence (mixed integer problems only), parameter `mi_int_tol`

MI_ABS_EPS the absolute tolerance between upper and lower bounds (mixed integer problems only), parameter `mi_abs_eps`

MI_REL_EPS the relative tolerance, $(U - L)/L$, between upper and lower bounds (mixed integer problems only), parameter `mi_rel_eps`

VERBOSE verbosity level, parameter `verbose`

ECOSolveR	*ECOSolveR: Embedded Conic Solver in R*

Description

`ECOSolveR` is a wrapper around the ecos library. Please see the examples and documentation for the function `ECOS_csolve`.

References

<https://github.com/embotech/ecos>

ECOS_csolve   *Solve a conic optimization problem*

Description

The function `ECOS_csolve` is a wrapper around the ecos `csolve` C function. Conic constraints are specified using the G and h parameters and can be NULL and zero length vector respectively indicating an absence of conic constraints. Similarly, equality constraints are specified via A and b parameters with NULL and empty vector values representing a lack of such constraints. At most one of the pair (G, h) or (A, b) is allowed to be absent.

Usage

```
ECOS_csolve(
  c = numeric(0),
  G = NULL,
  h = numeric(0),
  dims = list(l = integer(0), q = NULL, e = integer(0)),
  A = NULL,
  b = numeric(0),
  bool_vars = integer(0),
  int_vars = integer(0),
  control = ecos.control()
)
```

Arguments

c	the coefficients of the objective function; the length of this determines the number of variables n in the problem.
G	the inequality constraint matrix in one of three forms: a plain matrix, simple triplet matrix, or compressed column format, e.g. dgCMatrix-class. Can also be NULL
h	the right hand size of the inequality constraint. Can be empty numeric vector.
dims	is a list of three named elements: `dims['l']` an integer specifying the dimension of positive orthant cone, `dims['q']` an integer vector specifying dimensions of second-order cones, `dims['e']` an integer specifying the number of exponential cones
A	the optional equality constraint matrix in one of three forms: a plain matrix, simple triplet matrix, or compressed column format, e.g. dgCMatrix-class. Can be NULL
b	the right hand side of the equality constraint, must be specified if A is. Can be empty numeric vector.
bool_vars	the indices of the variables, 1 through n, that are boolean; that is, they are either present or absent in the solution
int_vars	the indices of the variables, 1 through n, that are integers
control	is a named list that controls various optimization parameters; see ecos.control.

Value

a list of 8 named items

x primal variables

y dual variables for equality constraints

s slacks for $Gx + s <= h$, $s \in K$

z dual variables for inequality constraints $s \in K$

infostring gives information about the status of solution

retcodes a named integer vector containing four elements

> **exitflag** `0=ECOS_OPTIMAL`, `1=ECOS_PINF`, `2=ECOS_DINF`, `10=ECOS_INACC_OFFSET`, `-1=ECOS_MAXIT`, `-2=ECOS_NUMERICS`, `-3=ECOS_OUTCONE`, `-4=ECOS_SIGINT`, `-7=ECOS_FATAL`. See ECOS_exitcodes.
>
> **iter** the number of iterations used
>
> **mi_iter** the number of iterations for mixed integer problems
>
> **numerr** a non-zero number if a numeric error occurred

summary a named numeric vector containing

> **pcost** value of primal objective
>
> **dcost** value of dual objective
>
> **pres** primal residual on inequalities and equalities
>
> **dres** dual residual
>
> **pinf** primal infeasibility measure
>
> **dinf** dual infeasibility measure
>
> **pinfres** primal infeasibility residual
>
> **dinfres** dual infeasibility residual
>
> **gap** duality gap
>
> **relgap** relative duality gap
>
> **r0** Unknown at the moment to this R package maintainer.

timing a named numeric vector of timing information consisting of

> **runtime** the total runtime in ecos
>
> **tsetup** the time for setup of the problem
>
> **tsolve** the time to solve the problem

Details

A call to this function will solve the problem: minimize $c^T x$, subject to $Ax = b$, and $h - G * x \in K$.

Variables can be constrained to be boolean (1 or 0) or integers. This is indicated by specifying parameters `bool_vars` and/or `int_vars` respectively. If so indicated, the solutions will be found using a branch and bound algorithm.

Examples

```
## githubIssue98
cat("Basic matrix interface\n")
