Package 'GeoFIS'

January 20, 2025

Type Package

Title Spatial Data Processing for Decision Making

Version 1.1.1

Author Serge Guillaume [aut],
Jean-Luc Lablée [aut, cre],
INRAE [cph] (National Research Institute for Agriculture, Food and
Environment, France)

Maintainer Jean-Luc Lablée <jean-luc.lablee@inrae.fr>

URL https://www.geofis.org

Description Methods for processing spatial data for decision-making.
This package is an R implementation of methods provided by the open source software GeoFIS <https://www.geofis.org> (Leroux et al. 2018) <doi:10.3390/agriculture8060073>.
The main functionalities are the management zone delineation (Pedroso et al. 2010) <doi:10.1016/j.compag.2009.10.007> and data aggregation (Mora-Herrera et al. 2020) <doi:10.1016/j.compag.2020.105624>.

Contents

AggregFis *Class "AggregFis"*

Description

The Fis aggregation operator to be used in [Fusion](#)

Slots

fis [FisPro::Fis](#) object, The Fis to be used in the aggregation operator

output_index [integer](#) value, The index (1-based index) of the output in the Fis to be used in the aggregation

See Also

NewAggregFis

Aggregation using linguistic rules

AggregFunction *Class "AggregFunction"*

Description

The functional aggregation operator to be used in Fusion

Slots

func Function, The function used for the aggregation

See Also

NewAggregFunction

AggregOwa *Class "AggregOwa"*

Description

The OWA aggregation operator to be used in Fusion

Slots

weights numeric vector, The weights of the OWA aggregation operator (the sum of the weights must be equal to 1 without negative values)

See Also

NewAggregOwa

Aggregation using numerical operators

AggregWam	*Class "AggregWam"*

Description

The WAM aggregation operator to be used in Fusion

Slots

weights numeric vector, The weights of the WAM aggregation operator (the sum of the weights must be equal to 1 without negative values)

See Also

NewAggregWam

Aggregation using numerical operators

---

conductivity_2014	*Soil conductivity 2014 dataset*

Description

The soil conductivity of a vine plot in year 2014

Usage

```
data(conductivity_2014)
```

Format

sp::SpatialPointsDataFrame object with 353 observations and 1 attribute:

conduct numeric value, The soil conductivity

---

conductivity_border	*Border dataset*

Description

The soil conductivity border of a vine plot

Usage

```
data(conductivity_border)
```

Format

sp::SpatialPolygonsDataFrame object with 1 polygon delimiting the border of the vine plot:

id integer value, The id of the polygon

DataInZone	*Classify data in management zones*

Description

Classify data in management zones of maps obtained with the Zoning algorithms.

Usage

```
DataInZone(data, maps, use_id = FALSE)
```

Arguments

data	sp::SpatialPointsDataFrame or sp::SpatialMultiPointsDataFrame object, The input data.
maps	sp::SpatialPolygonsDataFrame object, or a list of sp::SpatialPolygonsDataFrame, The map or list of maps to process.
use_id	boolean, Use the id attribute of the zone in the map if TRUE, or the order index (1-based indexed) of the zone in the map if FALSE (the default).

Value

sp::SpatialPointsDataFrame or sp::SpatialMultiPointsDataFrame object depending of the type of input data. Return table of membership of each point in the zones for each map, the input data and a column for each map processed (named "map{number of zones in the map}") with the class of each point.

EuclideanDistance   *The "Euclidean" distance*

Description

Function to create an "Euclidean" distance
To be used with the Zoning combine_distance or attribute_distance field

Usage

```
EuclideanDistance()
```

Value

Euclidean distance object

Fusion   *Class "Fusion"*

Description

The main class to perform data fusion
More information is available in the vignette "Data Fusion with GeoFIS"

Active bindings

aggregate data.tree::Node object, or a list of data.tree::Node, The node(s) to aggregate

Methods

Public methods:

- Fusion$new()
- Fusion$perform()
- Fusion$output()

Method new(): The constructor to build an object of class Fusion.

Usage:

```
Fusion$new(source)
```

Arguments:

source data.frame or sp::Spatial*DataFrame object of sp::sp package
    Keep only numeric attributes

Method perform(): Perform the data fusion

Usage:

```
Fusion$perform()
```

Method `output()`: Get the output aggregated data (same object type as data source)

Usage:

```
Fusion$output()
```

Returns: data.frame or sp::Spatial*DataFrame object

NewFusion

Data Fusion documentation

Examples

```
# more information about this example in the vignette "Data Fusion with GeoFIS"
# section "Learning illustration"

library(GeoFIS)

data(fusion_cars)

fusion <- NewFusion(fusion_cars)
a <- NewFusionInput("a", NewMfTrapezoidalInf(4, 20), "A")
v <- NewFusionInput("v", NewMfTrapezoidalSup(100, 500), "V")
s <- NewFusionInput("s", NewMfTrapezoidalSup(120, 220), "S")
c <- NewFusionInput("c", NewMfTrapezoidalInf(6, 16), "C")
owa_aggreg <- NewFusionAggreg("score", NewAggregOwa(c(1, 0, 0, 0)), a, v, s, c)
fusion$aggregate <- owa_aggreg
fusion$perform()
score <- fusion$output()["score"]
print(score)
```

FusionLabel   *Class "FusionLabel"*

Description

Defines the allowed labels for the [FisPro::Mf](#)s of the fuzzy inputs or output in the [FisPro::Fis](#) "Fusion"

Active bindings

very_low [character](#) vector (read-only), The very_low label

low [character](#) vector (read-only), The low label

average [character](#) vector (read-only), The average label

high [character](#) vector (read-only), The high label

very_high [character](#) vector (read-only), The very_high label

Methods

Public methods:

- [FusionLabel$get_labels()](#)

Method get_labels(): Get the allowed labels depending on the granularity in the [FisPro::Fis](#)
for granularity 2, allowed labels are: [low, high]
for granularity 3, allowed labels are: [low, average, high]
for granularity 4, allowed labels are: [very_low, low, high, very_high]
for granularity 5, allowed labels are: [very_low, low, average, high, very_high]

Usage:
FusionLabel$get_labels(granularity)

Arguments:

granularity [integer](#) value, The granularity of the fuzzy inputs or output in the [FisPro::Fis](#)
(value in range [2, 5])

Returns: [character](#) vector, The allowed labels for the granularity

---

fusion_cars   *Fusion Cars dataset*

Description

Illustration dataset for data fusion numerical operators learning

Usage

data(fusion_cars)

Format

[data.frame](#) object with four cars described by four attributes:

A [numeric](#) value, the acceleration time (s) from 0 to 100 km/h

V [numeric](#) value, the volume of the trunk (l)

S [numeric](#) value, the maximum speed (km/h)

C [numeric](#) value, the gas consumption (l per 100 km)

FuzzyDistance *The "Fuzzy" distance*

Description

Function to create a "Fuzzy" distance
The fuzzy distance function is based on a fuzzy partition that allows for integrating expert knowledge into distance calculations
To be used with the [Zoning](#) attribute_distance field

Usage

```
FuzzyDistance(fisin)
```

Arguments

fisin   [FisPro::FisIn](#) object, The partition used for the fuzzy distance (must be a standardized fuzzy partition)

Value

Fuzzy distance object

References

Guillaume S, Charnomordic B, Loisel P (2013). "Fuzzy partitions: a way to integrate expert knowledge into distance calculations." *International Journal of Information Sciences*, **245**, 76-95. [doi:10.1016/j.ins.2012.07.045](#).

LearnOwaWeights   *Learn the OWA weights*

Description

Learn the OWA weights using a non-negative least-square optimization method with the constraint that the sum of weights must be equal to 1. The input values are previously sorted in increasing order. The resulting weights are given from min to max. More information is available in the vignette "Data Fusion with GeoFIS", section "Learning illustration".

Usage

```
LearnOwaWeights(data, target, digits = 3)
```

Arguments

data	data.frame or numeric matrix, The input data (all columns must be in range [0, 1])
target	numeric vector, The target data (must be in range [0, 1])
digits	integer value, The number of digits to which weights are to be rounded (default is 3)

Value

numeric vector, The OWA weights

LearnWamWeights   *Learn the WAM weights*

Description

Learn the WAM weights using a non-negative least-square optimization method with the constraint that the sum of weights must be equal to 1.
More information is available in the vignette "Data Fusion with GeoFIS", section "Learning illustration".

Usage

```
LearnWamWeights(data, target, digits = 3)
```

Arguments

data	data.frame or numeric matrix, The input data (all columns must be in range [0, 1])
target	numeric vector, The target data (must be in range [0, 1])
digits	integer value, The number of digits to which weights are to be rounded (default is 3)

Value

[numeric](#) vector, The WAM weights

MaximumDistance   *The "Maximum" distance*

Description

Function to create a "Maximum" distance
To be used with the [Zoning](#) zone_distance field

Usage

```
MaximumDistance()
```

Value

Maximum distance object

MeanDistance   *The "Mean" distance*

Description

Function to create a "Mean" distance
To be used with the [Zoning](#) zone_distance field

Usage

```
MeanDistance()
```

Value

Mean distance object

MinimumDistance   *The "Minimum" distance*

Description

Function to create a "Minimum" distance
To be used with the [Zoning](#) zone_distance field

Usage

```
MinimumDistance()
```

Value

Minimum distance object

MinkowskiDistance   *The "Minkowski" distance*

Description

Function to create a "Minkowski" distance
To be used with the [Zoning](#) combine_distance field

Usage

```
MinkowskiDistance(power = 2)
```

Arguments

power   [numeric](#) value, The power of the Minkowski distance
                  The default value is 2 (equivalent to euclidean distance)

Value

Minkowski distance object

NewAggregFis   *Create object of class "AggregFis"*

Description

Function to create an aggregation operator of class AggregFis to be used in Fusion

Usage

```
NewAggregFis(fis, output_index = 1)
```

Arguments

fis	FisPro::Fis object, The Fis to be used in the aggregation operator
output_index	integer value, The index (1-based index) of the output in the Fis to be used in the aggregation (the default is 1)

Value

AggregFis object

See Also

Aggregation using linguistic rules

NewAggregFunction   *Create object of class "AggregFunction"*

Description

Function to create an aggregation operator of class AggregFunction to be used in Fusion

Usage

```
NewAggregFunction(func)
```

Arguments

func	The function to be used for the aggregation

NewAggregOwa   *Create object of class "AggregOwa"*

Description

Function to create an aggregation operator of class [AggregOwa](#) to be used in [Fusion](#)

Usage

```
NewAggregOwa(weights)
```

Arguments

weights   [numeric](#) vector, The weights of the OWA aggregation operator (the sum of the weights must be equal to 1 without negative values)

See Also

[Aggregation using numerical operators](#)

NewAggregWam   *Create object of class "AggregWam"*

Description

Function to create an aggregation operator of class [AggregWam](#) to be used in [Fusion](#)

Usage

```
NewAggregWam(weights)
```

Arguments

weights   [numeric](#) vector, The weights of the WAM aggregation operator (the sum of the weights must be equal to 1 without negative values)

See Also

[Aggregation using numerical operators](#)

NewFisFusion   *Create object of class "Fis" to be used in data fusion*

Description

Function to create object of class FisPro::Fis to be used in AggregFis

Usage

```
NewFisFusion(
  fis_name,
  input_names,
  input_granularities,
  output_name,
  output_conclusions
)
```

Arguments

fis_name   character vector, The name of the Fis

input_names   character vector, The Fis inputs names

input_granularities

         integer vector, The granularity (number of membership functions) for each Fis
input (granularity must be in range [2, 5])

output_name   character vector, The name of the Fis output

output_conclusions

         numeric or character vector, The conclusions of the rules in the Fis
the rules are generated according to the granularity of each input, in the lexico-
graphic order of inputs Mfs
(prod(input_granularities) rules are generated)
if numeric vector, a crisp output FisPro::FisOutCrisp will be added to the Fis
(all output conclusions must be be in range [0, 1])
if character vector, a fuzzy output FisPro::FisOutFuzzy will be added to the Fis,
the output_conclusions contains the labels of Mfs in the fuzzy output (labels de-
fined on FusionLabel)
the length of output_conclusions must be equal to the number of generated rules.

Value

FisPro::Fis object

See Also

Aggregation using linguistic rules

NewFusion   *Create object of class "Fusion"*

Description

Function to create object of class Fusion

Usage

```
NewFusion(...)
```

Arguments

`...`	arguments of Fusion constructor

Value

Fusion object

NewFusionAggreg   *Create an aggregation node to be used in data fusion*

Description

Function to create an aggregation node to be used in Fusion

Usage

```
NewFusionAggreg(name, aggreg, ...)
```

Arguments

`name`	character vector, The name of the node
`aggreg`	Aggreg object, The aggregation operator to be used to compute the aggregation of satisfaction degrees must be an AggregWam, AggregOwa, AggregFis or AggregFunction object
`...`	data.tree::Node objects, The nodes to aggregate can be an input node built with NewFusionInput or an aggregate node built with NewFusionAggreg for a hierarchical aggregation structure

Value

data.tree::Node object

See Also

Aggregation of the degrees

NewFusionInput   *Create an input node to be used in data fusion*

Description

Function to create an input node to be used in Fusion

Usage

```
NewFusionInput(name, mf, attribute = name)
```

Arguments

name	character vector, The name of the node
mf	FisPro::Mf object, The membership function to be used to compute the satisfaction degree of the input
attribute	character vector, The attribute name in the source dataset (default is the same as name)

Value

data.tree::Node object

See Also

From raw data to satisfaction degrees

NewZoning   *Create object of class "Zoning"*

Description

Function to create object of class Zoning

Usage

```
NewZoning(...)
```

Arguments

...	arguments of Zoning constructor

Value

Zoning object

---

tolima   *Tolima dataset*

Description

Soil experimental data in three municipalities of Tolima department in Colombia (Mora-Herrera et al. 2020)

Usage

```
data(tolima)
```

Format

data.frame object with 30 observations and 8 attributes:

Cadmium numeric value, Cadmium in Soil (ppm)

pH numeric value, pH Soil (°pH)

OM numeric value, Organic Matter (%)

P numeric value, Available Phosphorus (ppm)

K numeric value, Exchangeable Potassium (meq/100 g)

BalanceGap numeric value, Balance Gap (%)

Ngap_N_OpN numeric value, N Gap (N/Ntarget)

Base_S numeric value, Base Saturation (%)

References

Mora-Herrera DY, Guillaume S, Snoeck D, Zúñiga Escobar O (2020). "A fuzzy logic based soil chemical quality index for cacao." *Computers and Electronics in Agriculture*, **177**, 105624. doi:10.1016/ j.compag.2020.105624.

ZoneArea   *The "Area" smallest zone*

Description

Function to create an "Area" smallest zone
To be used with the Zoning smallest_zone field

Usage

```
ZoneArea(area)
```

Arguments

area numeric value, The minimum area of the zone to retain the zone in the Zoning process

Value

Area Smallest zone object

ZoneSize *The "Size" smallest zone*

Description

Function to create a "Size" smallest zone
To be used with the Zoning smallest_zone field

Usage

```
ZoneSize(number_of_points)
```

Arguments

number_of_points

integer value, The minimum number of points in the zone to retain the zone in the Zoning process

Value

Size Smallest zone object

Zoning *Class "Zoning"*

Description

The main class to perform zoning
A complete use-case example is described in the vignette "Zoning with GeoFIS"

Active bindings

border sp::SpatialPolygons object, The border used to limit the processed area, or NULL if the Convex Hull of data source is used

Only data points within the border polygon are processed

The default value is NULL

neighborhood numeric value, The minimum edge length shared by two Voronoi polygons for being considered as neighbors

or NULL if all contiguous Voronoi polygons are considered as neighbors

The default value is NULL

attribute_distance list of Distance object (write-only), The functions used to compute the distance between two data points in the attribute space

The length of the list must be equal to the number of zonable attributes, the distance objects are treated in the order of zonable attributes

In case of a single attribute into the zonable dataset, the list is optional and a single Distance object can be provided

Allowed distance objects: EuclideanDistance, FuzzyDistance or NULL if the attribute should not be used in the zoning process

The default value is a list of EuclideanDistance

See Zoning documentation main parameters univariate distance

combine_distance Distance object (write-only), The function used to combine attribute distances in case of multivariate zoning

Allowed distance objects: EuclideanDistance or MinkowskiDistance

The default value is EuclideanDistance See Zoning documentation main parameters multivariate combination

zone_distance Distance object (write-only), The function used to compute the distance between 2 zones

Allowed distance objects: MaximumDistance, MinimumDistance or MeanDistance

The default value is MaximumDistance

The pair of zones to be merged are those for which the zone_distance is minimum.

See Zoning documentation main parameters between zone distance

smallest_zone Smallest zone object (write-only), This criterion is used to determine the smallest size for a zone (number of points or area) to be kept in the final map

Allowed Smallest zone objects: ZoneSize or ZoneArea

The default value is ZoneSize with 1 point

Methods

Public methods:

- Zoning$new()
- Zoning$zonable_data()
- Zoning$perform_voronoi()
- Zoning$voronoi_map()
- Zoning$perform_neighborhood()

- `Zoning$neighborhood_map()`
- `Zoning$perform_zoning()`
- `Zoning$map_size()`
- `Zoning$map()`
- `Zoning$maps()`

Method new(): Constructor, create a new instance of [Zoning](#)

Usage:

`Zoning$new(source, warn = TRUE)`

Arguments:

source [sp::SpatialPointsDataFrame](#) or [sp::SpatialMultiPointsDataFrame](#) object, The data source

warn [logical](#) value, Show warnings if TRUE, default value is TRUE

Method zonable_data(): Get the zonable data
Keep only the attributes that can be used in the zoning process, meaning numeric atributes, without
missing values and with a range that is not limited to a unique value
The last condition is required by the min-max standardization process

Usage:

`Zoning$zonable_data()`

Returns: [sp::SpatialPointsDataFrame](#) object

Method perform_voronoi(): Compute the Voronoi diagram

Usage:

`Zoning$perform_voronoi()`

Method voronoi_map(): Get the Voronoi map

Usage:

`Zoning$voronoi_map()`

Returns: [sp::SpatialPolygons](#) object

Method perform_neighborhood(): Identify adjacent polygons in the voronoi tesselation

Usage:

`Zoning$perform_neighborhood()`

Method neighborhood_map(): Get the neighborhood map

Usage:

`Zoning$neighborhood_map()`

Returns: [sp::SpatialLinesDataFrame](#) object

Method perform_zoning(): Perform the zoning

Usage:

`Zoning$perform_zoning()`

Method map_size(): Get the number of maps with different number of zones available after
perform zoning

Usage:

```
Zoning$map_size()
```

Returns: integer value

Method map(): Get the map corresponding to a number of zones

Usage:

```
Zoning$map(number_of_zones)
```

Arguments:

number_of_zones integer value, The number of zones in the map

Returns: sp::SpatialPolygonsDataFrame object

Method maps(): Get the maps corresponding to a number of zones

Usage:

```
Zoning$maps(number_of_zones)
```

Arguments:

number_of_zones integer vector, The number of zones in each map

Returns: list of sp::SpatialPolygonsDataFrame object
