

# Package ‘MicroMoB’

January 20, 2025

**Type** Package

**Title** Discrete Time Simulation of Mosquito-Borne Pathogen Transmission

**Version** 0.1.2

**Description** Provides a framework based on S3 dispatch for constructing models of mosquito-borne pathogen transmission which are constructed from submodels of various components (i.e. immature and adult mosquitoes, human populations). A consistent mathematical expression for the distribution of bites on hosts means that different models (stochastic, deterministic, etc.) can be coherently incorporated and updated over a discrete time step.

**License** MIT + file LICENSE

**Encoding** UTF-8

**RoxygenNote** 7.2.1.9000

**Imports** abind, jsonlite

**Suggests** knitr, rmarkdown, testthat (>= 3.0.0), ggplot2, data.table, callr, httr, readr, withr, plumber

**VignetteBuilder** knitr

<code>api_config_global</code>	<i>Read global configuration options</i>
--------------------------------	--

---

**Description**

Read global configuration options

**Usage**

`api_config_global(path)`

**Arguments**

<code>path</code>	file path to a JSON file
-------------------	--------------------------

---

<code>approx_equal</code>	<i>Check if two numeric values are approximately equal</i>
---------------------------	--

---

**Description**

Check if two numeric values are approximately equal

**Usage**

`approx_equal(a, b, tol = sqrt(.Machine$double.eps))`

**Arguments**

<code>a</code>	a <b>numeric</b> object
<code>b</code>	a <b>numeric</b> object
<code>tol</code>	the numeric tolerance

**Value**

a logical value

compute\_bloodmeal      *Compute bloodmeals taken by mosquitoes on hosts*

---

### Description

This should be run prior to any step functions to update components over a time step. It computes various quantities related to disease transmission between species using the generic interfaces (methods) provided by each component. It updates the EIR vector for the human component, and kappa, the net infectiousness of hosts for the mosquito component.

### Usage

```
compute_bloodmeal(model)
```

### Arguments

model                  an object from [make\\_MicroMoB](#)

### Value

no return value

---

compute\_bloodmeal\_simple  
*Compute bloodmeals taken by mosquitoes on hosts in simple models*

---

### Description

The difference between this and [compute\\_bloodmeal](#) is that this function does not include any computations of alternative blood hosts or visitors and is suitable for models which only include mosquitoes and resident human populations.

### Usage

```
compute_bloodmeal_simple(model)
```

### Arguments

model                  an object from [make\\_MicroMoB](#)

### Value

no return value

---

compute\_emergents      *Compute number of newly emerging adults ( $\lambda$ )*

---

**Description**

This method dispatches on the type of `model$aqua`

**Usage**

```
compute_emergents(model)
```

**Arguments**

`model`                  an object from [make\\_MicroMoB](#)

**Value**

a vector of length `p` giving the number of newly emerging adult in each patch

---

`compute_emergents.BH`      *Compute number of newly emerging adults from Beverton-Holt dynamics*

---

**Description**

This function dispatches on the second class attribute of `model$aqua` for stochastic or deterministic behavior.

**Usage**

```
## S3 method for class 'BH'
compute_emergents(model)
```

**Arguments**

`model`                  an object from [make\\_MicroMoB](#)

**Value**

a vector of length `l` giving the number of newly emerging adult in each patch

---

```
compute_emergents.trace
```

*Compute number of newly emerging adults from forcing term*

---

### Description

This function dispatches on the second class attribute of `model$aqua` for stochastic or deterministic behavior.

### Usage

```
## S3 method for class 'trace'
compute_emergents(model)
```

### Arguments

`model` an object from [make\\_MicroMoB](#)

### Details

see [compute\\_emergents.trace\\_deterministic](#) and [compute\\_emergents.trace\\_stochastic](#)

### Value

no return value

---

```
compute_emergents.trace_deterministic
```

*Compute number of newly emerging adults from forcing term (deterministic)*

---

### Description

Return the column of the lambda matrix for this day.

### Usage

```
## S3 method for class 'trace_deterministic'
compute_emergents(model)
```

### Arguments

`model` an object from [make\\_MicroMoB](#)

### Value

a vector of length 1 giving the number of newly emerging adult in each patch

---

```
compute_emergents.trace_stochastic
```

*Compute number of newly emerging adults from forcing term (stochastic)*

---

### Description

Draw a Poisson distributed number of emerging adults with mean parameter from the column of the trace matrix for this day.

### Usage

```
## S3 method for class 'trace_stochastic'
compute_emergents(model)
```

### Arguments

model            an object from [make\\_MicroMoB](#)

### Value

a vector of length 1 giving the number of newly emerging adult in each patch

---

```
compute_f
```

*Compute mosquito feeding rate (f)*

---

### Description

This method dispatches on the type of model\$mosquito

### Usage

```
compute_f(model, B)
```

### Arguments

model            an object from [make\\_MicroMoB](#)  
 B                a vector of length p giving total blood host availability by patch

### Value

a vector of length p giving the per-capita blood feeding rate of mosquitoes in each patch

---

compute_f.BQ	<i>Compute mosquito feeding rate for BQ model (f)</i>
--------------	---

---

**Description**

Blood feeding rates are modeled as a Holling type 2 (rational) function of blood host availability.

$$f(B) = f_x \frac{s_f B}{1 + s_f B}$$

Here  $f_x$  is the maximum blood feeding rate and  $s_f$  is a scaling parameter.

**Usage**

```
## S3 method for class 'BQ'
compute_f(model, B)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
B	a vector of length p giving total blood host availability by patch

**Value**

a vector of length p giving the per-capita blood feeding rate of mosquitoes in each blood feeding haunt

---

compute_f.RM	<i>Compute mosquito feeding rate for RM model (f)</i>
--------------	---

---

**Description**

This method simply returns the  $f$  parameter of the mosquito object, because the RM model assumes a constant blood feeding rate.

**Usage**

```
## S3 method for class 'RM'
compute_f(model, B)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
B	a vector of length p giving total blood host availability by patch

**Value**

a vector of length p giving the per-capita blood feeding rate of mosquitoes in each patch

---

compute_f.trace	<i>Compute null mosquito feeding rate (f)</i>
-----------------	---

---

**Description**

Compute null mosquito feeding rate ( $f$ )

**Usage**

```
## S3 method for class 'trace'
compute_f(model, B)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
B	a vector of length $p$ giving total blood host availability by patch

**Value**

no return value

---

compute_H	<i>Compute human population strata sizes (H)</i>
-----------	--

---

**Description**

This method dispatches on the type of `model$human`.

**Usage**

```
compute_H(model)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
-------	--

**Value**

a vector of length  $n$  giving the size of each human population stratum

---

compute_H.MOI	<i>Compute human population strata sizes for MOI model (<math>H</math>)</i>
---------------	---

---

**Description**

Compute human population strata sizes for MOI model ( $H$ )

**Usage**

```
## S3 method for class 'MOI'
compute_H(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length  $n$  giving the size of each human population stratum

---

compute_H.SIP	<i>Compute human population strata sizes for SIP model (<math>H</math>)</i>
---------------	---

---

**Description**

Compute human population strata sizes for SIP model ( $H$ )

**Usage**

```
## S3 method for class 'SIP'
compute_H(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length  $n$  giving the size of each human population stratum

---

compute_H.SIR	<i>Compute human population strata sizes for SIR model (H)</i>
---------------	--

---

**Description**

Compute human population strata sizes for SIR model ( $H$ )

**Usage**

```
## S3 method for class 'SIR'  
compute_H(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length  $n$  giving the size of each human population stratum

---

compute_H.SIS	<i>Compute human population strata sizes for SIS model (H)</i>
---------------	--

---

**Description**

Compute human population strata sizes for SIS model ( $H$ )

**Usage**

```
## S3 method for class 'SIS'  
compute_H(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length  $n$  giving the size of each human population stratum

---

compute_0	<i>Compute available alternative blood hosts (O)</i>
-----------	--

---

**Description**

This method dispatches on the type of model\$alternative.

**Usage**

```
compute_0(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length p giving biting availability of other blood hosts at each patch

---

compute_0.trace	<i>Compute available alternative blood hosts for trace model (O)</i>
-----------------	--

---

**Description**

Compute available alternative blood hosts for trace model (O)

**Usage**

```
## S3 method for class 'trace'
compute_0(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length p giving biting availability of other blood hosts at each patch

---

compute_oviposit	<i>Compute number of eggs laid from oviposition for each patch</i>
------------------	--

---

**Description**

This method dispatches on the type of `model$mosquito`

**Usage**

```
compute_oviposit(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

a vector of length `l` giving the total number of eggs laid by adult mosquitoes in each aquatic habitat

---

compute_oviposit.BQ	<i>Compute number of eggs laid from oviposition for each aquatic habitat for BQ model</i>
---------------------	---

---

**Description**

This method returns a vector of length `l`.

**Usage**

```
## S3 method for class 'BQ'
compute_oviposit(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Details**

see [compute\\_oviposit.BQ\\_deterministic](#) and [compute\\_oviposit.BQ\\_stochastic](#)

**Value**

a vector of length `l` giving the total number of eggs laid by adult mosquitoes in each aquatic habitat

---

```
compute_oviposit.BQ_deterministic
```

*Compute number of eggs laid from oviposition for each patch for deterministic RM model*

---

### Description

Compute number of eggs laid from oviposition for each patch for deterministic RM model

### Usage

```
## S3 method for class 'BQ_deterministic'
compute_oviposit(model)
```

### Arguments

model                    an object from [make\\_MicroMoB](#)

### Value

a vector of length 1 giving the total number of eggs laid by adult mosquitoes in each aquatic habitat

---

```
compute_oviposit.BQ_stochastic
```

*Compute number of eggs laid from oviposition for each patch for stochastic RM model*

---

### Description

Compute number of eggs laid from oviposition for each patch for stochastic RM model

### Usage

```
## S3 method for class 'BQ_stochastic'
compute_oviposit(model)
```

### Arguments

model                    an object from [make\\_MicroMoB](#)

### Value

a vector of length 1 giving the total number of eggs laid by adult mosquitoes in each aquatic habitat

---

compute\_oviposit.RM    *Compute number of eggs laid from oviposition for each patch for RM model*

---

### Description

This method returns a vector of length  $p$ .

### Usage

```
## S3 method for class 'RM'
compute_oviposit(model)
```

### Arguments

model                    an object from [make\\_MicroMoB](#)

### Details

see [compute\\_oviposit.RM\\_deterministic](#) and [compute\\_oviposit.RM\\_stochastic](#)

### Value

a vector of length  $p$  giving the total number of eggs laid by adult mosquitoes in each patch

---

compute\_oviposit.RM\_deterministic  
*Compute number of eggs laid from oviposition for each patch for deterministic RM model*

---

### Description

Compute number of eggs laid from oviposition for each patch for deterministic RM model

### Usage

```
## S3 method for class 'RM_deterministic'
compute_oviposit(model)
```

### Arguments

model                    an object from [make\\_MicroMoB](#)

### Value

a vector of length  $p$  giving the total number of eggs laid by adult mosquitoes in each patch

---

```
compute_oviposit.RM_stochastic
```

*Compute number of eggs laid from oviposition for each patch for stochastic RM model*

---

### Description

Compute number of eggs laid from oviposition for each patch for stochastic RM model

### Usage

```
## S3 method for class 'RM_stochastic'
compute_oviposit(model)
```

### Arguments

model            an object from [make\\_MicroMoB](#)

### Value

a vector of length 1 giving the total number of eggs laid by adult mosquitoes in each patch

---

```
compute_oviposit.trace
```

*Compute number of eggs laid from oviposition for each patch for null model*

---

### Description

This method dispatches on the type of model\$mosquito

### Usage

```
## S3 method for class 'trace'
compute_oviposit(model)
```

### Arguments

model            an object from [make\\_MicroMoB](#)

### Value

a vector of length p giving the total number of eggs laid by adult mosquitoes in each patch

---

compute_Psi	<i>Compute time at risk matrix (<math>\Psi</math>)</i>
-------------	--

---

**Description**

The time at risk matrix is  $\Psi = \Theta\xi$ . This method dispatches on the type of `model$human`.

**Usage**

```
compute_Psi(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

a matrix with `n` rows and `p` columns, the time at risk matrix

---

compute_Psi.MOI	<i>Compute time at risk matrix for MOI model (<math>\Psi</math>)</i>
-----------------	--

---

**Description**

Compute time at risk matrix for MOI model ( $\Psi$ )

**Usage**

```
## S3 method for class 'MOI'
compute_Psi(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

a matrix with `n` rows and `p` columns, the time at risk matrix

---

compute_Psi.SIP	<i>Compute time at risk matrix for SIP model (<math>\Psi</math>)</i>
-----------------	--

---

**Description**

Compute time at risk matrix for SIP model ( $\Psi$ )

**Usage**

```
## S3 method for class 'SIP'  
compute_Psi(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a matrix with n rows and p columns, the time at risk matrix

---

compute_Psi.SIR	<i>Compute time at risk matrix for SIR model (<math>\Psi</math>)</i>
-----------------	--

---

**Description**

Compute time at risk matrix for SIR model ( $\Psi$ )

**Usage**

```
## S3 method for class 'SIR'  
compute_Psi(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a matrix with n rows and p columns, the time at risk matrix

---

compute_Psi.SIS	<i>Compute time at risk matrix for SIS model (<math>\Psi</math>)</i>
-----------------	--

---

**Description**

Compute time at risk matrix for SIS model ( $\Psi$ )

**Usage**

```
## S3 method for class 'SIS'
compute_Psi(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a matrix with n rows and p columns, the time at risk matrix

---

compute_q	<i>Compute human blood feeding fraction (<math>q</math>)</i>
-----------	--

---

**Description**

This method dispatches on the type of `model$mosqui` to

**Usage**

```
compute_q(model, W, Wd, B)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)  
W                a vector of length p giving human availability by patch ( $W$ )  
Wd               a vector of length p giving visitor availability by patch ( $W_\delta$ )  
B                a vector of length p giving total blood host availability by patch ( $B$ )

**Value**

a vector of length p giving the proportion of bites taken on human hosts in each patch

---

compute\_q.BQ                      *Compute human blood feeding fraction for BQ model (q)*

---

### Description

The human blood feeding fraction is simply the proportion of human hosts.

### Usage

```
## S3 method for class 'BQ'
compute_q(model, W, Wd, B)
```

### Arguments

model	an object from <a href="#">make_MicroMoB</a>
W	a vector of length $p$ giving human availability by patch ( $W$ )
Wd	a vector of length $p$ giving visitor availability by patch ( $W_\delta$ )
B	a vector of length $p$ giving total blood host availability by patch ( $B$ )

### Value

a vector of length  $p$  giving the proportion of bites taken on human hosts in each blood feeding haunt

---

compute\_q.RM                      *Compute human blood feeding fraction for RM model (q)*

---

### Description

This method simply returns the  $q$  parameter of the mosquito object, because the RM model assumes a constant fraction of blood meals are taken on human hosts.

### Usage

```
## S3 method for class 'RM'
compute_q(model, W, Wd, B)
```

### Arguments

model	an object from <a href="#">make_MicroMoB</a>
W	a vector of length $p$ giving human availability by patch ( $W$ )
Wd	a vector of length $p$ giving visitor availability by patch ( $W_\delta$ )
B	a vector of length $p$ giving total blood host availability by patch ( $B$ )

### Value

a vector of length  $p$  giving the proportion of bites taken on human hosts in each patch

---

compute_q.trace	<i>Compute null human blood feeding fraction (<math>q</math>)</i>
-----------------	---

---

**Description**

Compute null human blood feeding fraction ( $q$ )

**Usage**

```
## S3 method for class 'trace'
compute_q(model, W, Wd, B)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
W	a vector of length $p$ giving human availability by patch ( $W$ )
Wd	a vector of length $p$ giving visitor availability by patch ( $W_\delta$ )
B	a vector of length $p$ giving total blood host availability by patch ( $B$ )

**Value**

no return value

---

compute_Wd	<i>Compute available visitors (<math>W_\delta</math>)</i>
------------	---

---

**Description**

This method dispatches on the type of `model$visitor`.

**Usage**

```
compute_Wd(model)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
-------	--

**Value**

a vector of length  $p$  giving biting availability of visitors at each patch

---

compute_Wd.trace	<i>Compute available visitors for trace model (<math>W_\delta</math>)</i>
------------------	---

---

**Description**

Compute available visitors for trace model ( $W_\delta$ )

**Usage**

```
## S3 method for class 'trace'
compute_Wd(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length p giving biting availability of visitors at each patch

---

compute_wf	<i>Compute human biting weights (<math>w_f</math>)</i>
------------	--

---

**Description**

This method dispatches on the type of model\$human.

**Usage**

```
compute_wf(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length n giving the biting weights of human hosts in each stratum

---

compute_wf.MOI	<i>Compute human biting weights for MOI model (<math>w_f</math>)</i>
----------------	--

---

**Description**

Compute human biting weights for MOI model ( $w_f$ )

**Usage**

```
## S3 method for class 'MOI'  
compute_wf(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length n giving the biting weights of human hosts in each stratum

---

compute_wf.SIP	<i>Compute human biting weights for SIP model (<math>w_f</math>)</i>
----------------	--

---

**Description**

Compute human biting weights for SIP model ( $w_f$ )

**Usage**

```
## S3 method for class 'SIP'  
compute_wf(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length n giving the biting weights of human hosts in each stratum

---

compute_wf.SIR	<i>Compute human biting weights for SIR model (<math>w_f</math>)</i>
----------------	--

---

**Description**

Compute human biting weights for SIR model ( $w_f$ )

**Usage**

```
## S3 method for class 'SIR'
compute_wf(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length n giving the biting weights of human hosts in each stratum

---

compute_wf.SIS	<i>Compute human biting weights for SIS model (<math>w_f</math>)</i>
----------------	--

---

**Description**

Compute human biting weights for SIS model ( $w_f$ )

**Usage**

```
## S3 method for class 'SIS'
compute_wf(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length n giving the biting weights of human hosts in each stratum

---

compute_x	<i>Compute net infectiousness of humans (x)</i>
-----------	---

---

**Description**

In a Ross-Macdonald style transmission model, this is computed as

$$x = cX$$

This method dispatches on the type of `model$human`.

**Usage**

```
compute_x(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

a vector of length `n` giving the net infectiousness of human hosts in each stratum

---

compute_x.MOI	<i>Compute net infectiousness for MOI model (x)</i>
---------------	---

---

**Description**

In the simple MOI (queueing) model here (M/M/inf), net infectiousness is considered not to vary with increasing MOI. It is calculated as

$$c \cdot \left(1 - \frac{X_0}{H}\right)$$

where  $X_0$  is the number of uninfected persons (multiplicity of infection of zero).

**Usage**

```
## S3 method for class 'MOI'
compute_x(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

a vector of length `n` giving the net infectiousness of human hosts in each stratum

---

compute_x.SIP	<i>Compute net infectiousness for SIP model (<math>x</math>)</i>
---------------	--

---

**Description**

Compute net infectiousness for SIP model ( $x$ )

**Usage**

```
## S3 method for class 'SIP'
compute_x(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length  $n$  giving the net infectiousness of human hosts in each stratum

---

compute_x.SIR	<i>Compute net infectiousness for SIR model (<math>x</math>)</i>
---------------	--

---

**Description**

Compute net infectiousness for SIR model ( $x$ )

**Usage**

```
## S3 method for class 'SIR'
compute_x(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length  $n$  giving the net infectiousness of human hosts in each stratum

---

compute_x.SIS	<i>Compute net infectiousness for SIS model (<math>x</math>)</i>
---------------	--

---

**Description**

Compute net infectiousness for SIS model ( $x$ )

**Usage**

```
## S3 method for class 'SIS'
compute_x(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length  $n$  giving the net infectiousness of human hosts in each stratum

---

compute_xd	<i>Compute net infectiousness of visitors (<math>x_\delta</math>)</i>
------------	---

---

**Description**

This method dispatches on the type of `model$visitor`.

**Usage**

```
compute_xd(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length  $p$  giving net infectiousness of visitors at each patch

---

compute_xd.trace	<i>Compute net infectiousness of visitors for trace model (<math>x_\delta</math>)</i>
------------------	---

---

**Description**

Compute net infectiousness of visitors for trace model ( $x_\delta$ )

**Usage**

```
## S3 method for class 'trace'
compute_xd(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length p giving net infectiousness of visitors at each patch

---

compute_Z	<i>Compute density of infective mosquitoes (<math>Z</math>)</i>
-----------	---

---

**Description**

This method dispatches on the type of model\$mosquito.  $Z$  is also known as the "sporozoite rate" in malariology.

**Usage**

```
compute_Z(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length p giving the density of infected and infectious mosquitoes in each patch

---

compute_Z.BQ	<i>Compute density of infective mosquitoes for BQ model (Z)</i>
--------------	---

---

**Description**

This method returns Z.

**Usage**

```
## S3 method for class 'BQ'
compute_Z(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length p giving the density of infected and infectious mosquitoes in each blood feeding haunt

---

compute_Z.RM	<i>Compute density of infective mosquitoes for RM model (Z)</i>
--------------	---

---

**Description**

This method returns Z.

**Usage**

```
## S3 method for class 'RM'
compute_Z(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector of length p giving the density of infected and infectious mosquitoes in each patch

---

compute_Z.trace	<i>Compute null density of infective mosquitoes (Z)</i>
-----------------	---

---

**Description**

Compute null density of infective mosquitoes ( $Z$ )

**Usage**

```
## S3 method for class 'trace'  
compute_Z(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

distribute	<i>Distribute items into bins as evenly as possible</i>
------------	---

---

**Description**

Distribute items into bins as evenly as possible

**Usage**

```
distribute(n, p)
```

**Arguments**

n                number of bins  
p                number of items

**Value**

a numeric vector of bin sizes

---

divmod	<i>Division of integers</i>
--------	-----------------------------

---

**Description**

Division of integers

**Usage**

```
divmod(a, b)
```

**Arguments**

a	the dividend
b	the divisor

**Value**

a list with two elements, quo (quotient) and rem (remainder)

---

draw_multinom	<i>Draw a multinomially distributed random vector</i>
---------------	---

---

**Description**

Warning: this function does no argument checking. Ensure the arguments are as follows.

**Usage**

```
draw_multinom(n, prob)
```

**Arguments**

n	an integer giving the number of balls to distribute in bins
prob	a vector of probabilities for each bin, which must sum to one

**Value**

an integer vector of length equal to the length of prob

**Note**

This function uses the algorithm presented in: Startek, Michał. "An asymptotically optimal, on-line algorithm for weighted random sampling with replacement." arXiv preprint arXiv:1611.00532 (2016).

---

```
get_config_alternative_trace
```

*Get parameters for trace driven alternative blood hosts*

---

### Description

The JSON config file should have two entries:

- O: vector or matrix (see [time\\_patch\\_varying\\_parameter](#) for valid dimensions)

For interpretation of the entries, please read [setup\\_alternative\\_trace](#).

### Usage

```
get_config_alternative_trace(path)
```

### Arguments

path                    a file path to a JSON file

### Value

a named [list](#)

### Examples

```
# to see an example of proper JSON input, run the following
library(jsonlite)
par <- list(
  "O" = rep(1, 5)
)
toJSON(par, pretty = TRUE)
```

---

```
get_config_aqua_BH
```

*Get parameters for aquatic (immature) model with Beverton-Holt dynamics*

---

### Description

The JSON config file should have two entries:

- stochastic: a boolean value
- molt: a scalar, vector, or matrix (row major)
- surv: a scalar, vector, or matrix (row major)
- K: a scalar, vector, or matrix (row major)
- L: a vector

Please see [time\\_patch\\_varying\\_parameter](#) for allowed dimensions of entries molt, surv, and K. L should be of length equal to the number of patches. For interpretation of the entries, please read [setup\\_aqua\\_BH](#).

**Usage**

```
get_config_aqua_BH(path)
```

**Arguments**

path                    a file path to a JSON file

**Value**

a named [list](#)

**Examples**

```
# to see an example of proper JSON input, run the following
library(jsonlite)
p <- 5 # number of patches
t <- 10 # number of days to simulate
par <- list(
  "stochastic" = FALSE,
  "molt" = 0.3,
  "surv" = rep(0.5, 365),
  "K" = matrix(rpois(n = t * p, lambda = 100), nrow = p, ncol = t),
  "L" = rep(10, p)
)
toJSON(par, pretty = TRUE)
```

---

get\_config\_aqua\_trace *Get parameters for aquatic (immature) model with forced emergence*

---

**Description**

The JSON config file should have two entries:

- stochastic: a boolean value
- lambda: a scalar, vector, or matrix (row major). It will be passed to [time\\_patch\\_varying\\_parameter](#), see that function's documentation for appropriate dimensions.

For interpretation of the entries, please read [setup\\_aqua\\_trace](#).

**Usage**

```
get_config_aqua_trace(path)
```

**Arguments**

path                    a file path to a JSON file

**Value**

a named [list](#)

## Examples

```
# to see an example of proper JSON input, run the following
library(jsonlite)
t <- 10 # number of days to simulate
par <- list(
  "stochastic" = FALSE,
  "lambda" = rpois(n = t, lambda = 10)
)
toJSON(par, pretty = TRUE)
```

---

get\_config\_humans\_MOI *Get parameters for MOI human model*

---

## Description

The JSON config file should have 9 entries:

- stochastic: a boolean value
- theta: matrix (row major)
- wf: vector
- H: vector
- MOI: matrix (row major)
- b: scalar
- c: scalar
- r: scalar
- sigma: scalar

For interpretation of the entries, please read [setup\\_humans\\_MOI](#).

## Usage

```
get_config_humans_MOI(path)
```

## Arguments

path                    a file path to a JSON file

## Value

a named [list](#)

## Examples

```
# to see an example of proper JSON input, run the following
library(jsonlite)
n <- 6 # number of human population strata
p <- 5 # number of patches
theta <- matrix(rexp(n*p), nrow = n, ncol = p)
theta <- theta / rowSums(theta)
H <- rep(10, n)
MOI <- matrix(0, nrow = 10, ncol = n)
MOI[1, ] <- H
par <- list(
  "stochastic" = FALSE,
  "theta" = theta,
  "wf" = rep(1, n),
  "H" = H,
  "MOI" = MOI,
  "b" = 0.55,
  "c" = 0.15,
  "r" = 1/200,
  "sigma" = 1
)
toJSON(par, pretty = TRUE)
```

---

get\_config\_humans\_SIR *Get parameters for SIR human model*

---

## Description

The JSON config file should have 8 entries:

- stochastic: a boolean value
- theta: matrix (row major)
- wf: vector
- H: vector
- SIR: matrix (row major)
- b: scalar
- c: scalar
- gamma: scalar

For interpretation of the entries, please read [setup\\_humans\\_SIR](#).

## Usage

```
get_config_humans_SIR(path)
```

## Arguments

path                    a file path to a JSON file

**Value**

a named [list](#)

**Examples**

```
# to see an example of proper JSON input, run the following
library(jsonlite)
n <- 6 # number of human population strata
p <- 5 # number of patches
theta <- matrix(rexp(n*p), nrow = n, ncol = p)
theta <- theta / rowSums(theta)
H <- rep(10, n)
SIR <- matrix(0, nrow = n, ncol = 3)
SIR[, 1] <- H
par <- list(
  "stochastic" = FALSE,
  "theta" = theta,
  "wf" = rep(1, n),
  "H" = H,
  "SIR" = SIR,
  "b" = 0.55,
  "c" = 0.15,
  "gamma" = 1/7
)
toJSON(par, pretty = TRUE)
```

---

get\_config\_humans\_SIS *Get parameters for SIS human model*

---

**Description**

The JSON config file should have 8 entries:

- stochastic: a boolean value
- theta: matrix (row major)
- wf: vector
- H: vector
- X: vector
- b: scalar
- c: scalar
- r: scalar

For interpretation of the entries, please read [setup\\_humans\\_SIS](#).

**Usage**

```
get_config_humans_SIS(path)
```

**Arguments**

path                    a file path to a JSON file

**Value**

a named [list](#)

**Examples**

```
# to see an example of proper JSON input, run the following
library(jsonlite)
n <- 6 # number of human population strata
p <- 5 # number of patches
theta <- matrix(rexp(n*p), nrow = n, ncol = p)
theta <- theta / rowSums(theta)
H <- rep(10, n)
X <- rep(3, n)
par <- list(
  "stochastic" = FALSE,
  "theta" = theta,
  "wf" = rep(1, n),
  "H" = H,
  "X" = X,
  "b" = 0.55,
  "c" = 0.15,
  "r" = 1/200
)
toJSON(par, pretty = TRUE)
```

---

get\_config\_mosquito\_RM

*Get parameters for generalized Ross-Macdonald mosquito model*

---

**Description**

The JSON config file should have 8 entries:

- stochastic: a boolean value
- f: scalar
- q: scalar
- eip: scalar or vector; see [time\\_varying\\_parameter](#) for valid formats
- p: scalar or vector; see [time\\_varying\\_parameter](#) for valid formats
- psi: matrix
- nu: scalar
- M: vector
- Y: vector
- Z: vector

For interpretation of the entries, please read [setup\\_mosquito\\_RM](#).

**Usage**

```
get_config_mosquito_RM(path)
```

**Arguments**

path                    a file path to a JSON file

**Value**

a named [list](#)

**Examples**

```
# to see an example of proper JSON input, run the following
library(jsonlite)
t <- 10 # days to simulate
p <- 5 # number of patches
EIP <- rep(5, t)
p_surv <- 0.95
psi <- matrix(rexp(p^2), nrow = p, ncol = p)
psi <- psi / rowSums(psi)
par <- list(
  "stochastic" = FALSE,
  "f" = 0.3,
  "q" = 0.9,
  "eip" = EIP,
  "p" = p_surv,
  "psi" = psi,
  "nu" = 20,
  "M" = rep(100, p),
  "Y" = rep(20, p),
  "Z" = rep(5, p)
)
toJSON(par, pretty = TRUE)
```

---

```
get_config_mosquito_trace
```

*Get parameters for null mosquito model*

---

**Description**

The JSON config file should have 1 entry:

- oviposit: vector

For interpretation of the entries, please read [setup\\_mosquito\\_trace](#).

**Usage**

```
get_config_mosquito_trace(path)
```

**Arguments**

path                    a file path to a JSON file

**Value**

a named [list](#)

**Examples**

```
# to see an example of proper JSON input, run the following
library(jsonlite)
par <- list(
  "oviposit" = rep(1, 5)
)
toJSON(par, pretty = TRUE)
```

---

get\_config\_visitor\_trace

*Get parameters for trace driven visitors*

---

**Description**

The JSON config file should have two entries:

- Wd: vector or matrix (see [time\\_patch\\_varying\\_parameter](#) for valid dimensions)
- xd: vector or matrix (see [time\\_patch\\_varying\\_parameter](#) for valid dimensions)

For interpretation of the entries, please read [setup\\_visitor\\_trace](#).

**Usage**

```
get_config_visitor_trace(path)
```

**Arguments**

path                    a file path to a JSON file

**Value**

a named [list](#)

**Examples**

```
# to see an example of proper JSON input, run the following
library(jsonlite)
par <- list(
  "Wd" = rep(1, 5),
  "xd" = rep(0.01, 365)
)
toJSON(par, pretty = TRUE)
```

---

get\_eip\_mosquito\_RM     *Get extrinsic incubation period for Ross-Macdonald mosquito model*

---

**Description**

Get extrinsic incubation period for Ross-Macdonald mosquito model

**Usage**

```
get_eip_mosquito_RM(model, times)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
times	vector of times to return

**Value**

no return value

---

get\_f\_mosquito\_RM     *Get feeding rate for Ross-Macdonald mosquito model*

---

**Description**

Get feeding rate for Ross-Macdonald mosquito model

**Usage**

```
get_f_mosquito_RM(model)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
-------	--

**Value**

a vector

---

*get\_kappa\_mosquito\_RM* *Get kappa for Ross-Macdonald mosquito model*

---

**Description**

Get kappa for Ross-Macdonald mosquito model

**Usage**

```
get_kappa_mosquito_RM(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a vector

---

*get\_K\_aqua\_BH*            *Get carrying capacity for Beverton-Holt aquatic mosquito model*

---

**Description**

Get carrying capacity for Beverton-Holt aquatic mosquito model

**Usage**

```
get_K_aqua_BH(model, times, places)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)  
times            vector of times to get values  
places            vector of places to get values

**Value**

a [matrix](#)

---

get\_lambda\_aqua\_trace *Get daily emergence for Beverton-Holt aquatic mosquito model*

---

**Description**

Get daily emergence for Beverton-Holt aquatic mosquito model

**Usage**

```
get_lambda_aqua_trace(model, times, places)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
times	vector of times to get values
places	vector of places to get values

**Value**

a [matrix](#)

---

get\_molt\_aqua\_BH *Get daily maturation probability for Beverton-Holt aquatic mosquito model*

---

**Description**

Get daily maturation probability for Beverton-Holt aquatic mosquito model

**Usage**

```
get_molt_aqua_BH(model, times, places)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
times	vector of times to get values
places	vector of places to get values

**Value**

a [matrix](#)

---

get\_nu\_mosquito\_RM     *Get number of eggs laid per oviposition for Ross-Macdonald mosquito model*

---

**Description**

Get number of eggs laid per oviposition for Ross-Macdonald mosquito model

**Usage**

get\_nu\_mosquito\_RM(model)

**Arguments**

model                    an object from [make\\_MicroMoB](#)

**Value**

a vector

---

get\_psi\_mosquito\_RM     *Get mosquito dispersal matrix for Ross-Macdonald mosquito model*

---

**Description**

Get mosquito dispersal matrix for Ross-Macdonald mosquito model

**Usage**

get\_psi\_mosquito\_RM(model)

**Arguments**

model                    an object from [make\\_MicroMoB](#)

**Value**

a matrix

---

get\_p\_mosquito\_RM      *Get daily survival probability for Ross-Macdonald mosquito model*

---

**Description**

Get daily survival probability for Ross-Macdonald mosquito model

**Usage**

```
get_p_mosquito_RM(model, times, places)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
times	vector of times to get values
places	vector of places to get values

**Value**

a matrix

---

get\_q\_mosquito\_RM      *Get human blood feeding fraction for Ross-Macdonald mosquito model*

---

**Description**

Get human blood feeding fraction for Ross-Macdonald mosquito model

**Usage**

```
get_q_mosquito_RM(model)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
-------	--

**Value**

a vector

---

get_surv_aqua_BH	<i>Get daily survival probability for Beverton-Holt aquatic mosquito model</i>
------------------	--

---

**Description**

Get daily survival probability for Beverton-Holt aquatic mosquito model

**Usage**

```
get_surv_aqua_BH(model, times, places)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
times	vector of times to get values
places	vector of places to get values

**Value**

a [matrix](#)

---

get_tmax	<i>Get maximum time of simulation from model object</i>
----------	---

---

**Description**

Get maximum time of simulation from model object

**Usage**

```
get_tmax(model)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
-------	--

---

get_tnow	<i>Get current time of simulation from model object</i>
----------	---

---

**Description**

Get current time of simulation from model object

**Usage**

```
get_tnow(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

---

is_binary	<i>Does a numeric object consist of only zeros and ones?</i>
-----------	--

---

**Description**

Does a numeric object consist of only zeros and ones?

**Usage**

```
is_binary(x)
```

**Arguments**

x                a [numeric](#) object

**Value**

a logical value

---

make_MicroMoB	<i>Make a model object</i>
---------------	----------------------------

---

### Description

The model object is a hashed [environment](#). By default it contains a single list, `model$global` storing global state.

### Usage

```
make_MicroMoB(tmax, p, l = p)
```

### Arguments

tmax	number of days to simulate
p	number of places
l	number of aquatic habitats (optional, will be set to p by default)

### Value

an object of class [environment](#)

---

MicroMoB	<i>MicroMoB: Microsimulation for mosquito-borne pathogens</i>
----------	---

---

### Description

Discrete time simulation of mosquito-borne pathogen transmission

observe_pfpr	<i>Observe PfPR in human strata</i>
--------------	-------------------------------------

---

**Description**

This method dispatches on the type of `model$human`.

**Usage**

```
observe_pfpr(model, parameters)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
parameters	a named <a href="#">list</a> , should have elements <code>sens</code> (sensitivity), <code>spec</code> (specificity), and a vector of length equal to number of strata <code>testprop</code> which gives the proportion of each strata to be tested.

**Value**

an [array](#) of counts, with actual condition as first dimension and tested condition as the second dimension, and the third dimension is the human strata

---

observe_pfpr.SIP	<i>Observe PfPR in human strata for SIP model</i>
------------------	---

---

**Description**

Observe PfPR in human strata for SIP model

**Usage**

```
## S3 method for class 'SIP'
observe_pfpr(model, parameters)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
parameters	a named <a href="#">list</a> , should have elements <code>sens</code> (sensitivity), <code>spec</code> (specificity), and a vector of length equal to number of strata <code>testprop</code> which gives the proportion of each strata to be tested.

**Value**

an [array](#) of counts, with actual condition as first dimension and tested condition as the second dimension, and the third dimension is the human strata

---

observe_pfpr.SIS	<i>Observe PfPR in human strata for SIS model</i>
------------------	---

---

**Description**

Observe PfPR in human strata for SIS model

**Usage**

```
## S3 method for class 'SIS'
observe_pfpr(model, parameters)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
parameters	a named <a href="#">list</a> , should have elements sens (sensitivity), spec (specificity), and a vector of length equal to number of strata testprop which gives the proportion of each strata to be tested.

**Value**

an [array](#) of counts, with actual condition as first dimension and tested condition as the second dimension, and the third dimension is the human strata

---

output_aqua	<i>Get output for aquatic (immature) mosquito populations</i>
-------------	---

---

**Description**

This method dispatches on the type of model\$aqua. It returns the current state of the aquatic component.

**Usage**

```
output_aqua(model)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
-------	--

**Value**

a [data.frame](#)

---

output_aqua.BH	<i>Get output for aquatic (immature) mosquito populations with Beverton-Holt dynamics</i>
----------------	---

---

**Description**

Return a [data.frame](#).

**Usage**

```
## S3 method for class 'BH'  
output_aqua(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a [data.frame](#) with columns L (immature) and A (emerging pupae)

---

output_aqua.trace	<i>Get output for aquatic (immature) mosquito populations with forced emergence</i>
-------------------	---

---

**Description**

This function returns an empty [data.frame](#) as trace models do not have endogenous dynamics.

**Usage**

```
## S3 method for class 'trace'  
output_aqua(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

a [data.frame](#)

---

output_mosquitoes	<i>Get output for mosquito populations</i>
-------------------	--

---

**Description**

This method dispatches on the type of `model$mosquito`. It returns the current state of the adult mosquito component.

**Usage**

```
output_mosquitoes(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

a [data.frame](#)

---

output_mosquitoes.RM	<i>Get output for Ross-Macdonald mosquito populations</i>
----------------------	---

---

**Description**

Return a [data.frame](#).

**Usage**

```
## S3 method for class 'RM'  
output_mosquitoes(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

a [data.frame](#) with columns M (all adult mosquitoes), Y (infected mosquitoes), and Z (infectious mosquitoes), and rows correspond to places.

---

```
output_mosquitoes.trace
```

*Get output for null mosquito populations*

---

### Description

This function returns an empty [data.frame](#) as trace models do not have endogenous dynamics.

### Usage

```
## S3 method for class 'trace'  
output_mosquitoes(model)
```

### Arguments

model                    an object from [make\\_MicroMoB](#)

### Value

a [data.frame](#)

---

```
sample_stochastic_matrix
```

*Sample a stochastic matrix*

---

### Description

x is a matrix with arbitrary number of rows but whose columns are equal to the number of bins that the stochastic matrix prob parameterizes a distribution over. Each row of x gives a distribution of counts over bins and is resampled according to prob. It is conceptually similar to "stochastically" distributing the matrix as `x %*% prob`, which gives the expectation.

### Usage

```
sample_stochastic_matrix(x, prob)
```

### Arguments

x                        a matrix

prob                     a matrix, it must have number of columns equal to the number of columns of x and rows that sum to one

### Value

a matrix whose dimensions equal the original x

---

 sample\_stochastic\_vector

*Sample a stochastic vector*

---

### Description

Given a vector of counts in cells, `x` and a stochastic matrix `prob`, each row of which describes a probability distribution of how that cell should be distributed among bins, sample destination bins for each cell count, and return a vector giving the number of counts in bins. It is conceptually similar to "stochastically" distributing the vector as `x**% prob`, which gives the expectation.

### Usage

```
sample_stochastic_vector(x, prob)
```

### Arguments

<code>x</code>	a vector
<code>prob</code>	a matrix, it must have number of rows equal to <code>x</code> and rows that sum to one

### Value

a vector of length equal to the number of columns of `prob`

---

setup\_alternative\_trace

*Setup trace driven alternative blood hosts*

---

### Description

This model complies with the visitors component interface. It adds a named list `model$alternative`.

### Usage

```
setup_alternative_trace(model, 0 = NULL)
```

### Arguments

<code>model</code>	an object from <a href="#">make_MicroMoB</a>
<code>0</code>	a time varying trace passed to <a href="#">time_patch_varying_parameter</a> or NULL to set to $\emptyset$ (no alternative blood hosts)

### Value

no return value

---

setup_aqua_BH	<i>Setup aquatic (immature) mosquito model with Beverton-Holt dynamics</i>
---------------	--

---

### Description

A single compartment for all aquatic stages is modeled which suffers density dependent mortality like the Beverton-Holt model.

### Usage

```
setup_aqua_BH(model, stochastic, molt, surv, K, L)
```

### Arguments

model	an object from <a href="#">make_MicroMoB</a>
stochastic	should the model update deterministically or stochastically?
molt	proportion of immature stages which will mature and emerge as adults each day (may be time and patch varying see <a href="#">time_patch_varying_parameter</a> )
surv	daily survival probability (may be time and patch varying see <a href="#">time_patch_varying_parameter</a> )
K	carrying capacity (may be time and patch varying see <a href="#">time_patch_varying_parameter</a> )
L	initial number of immature mosquitoes

### Details

All parameters can be passed either as a vector of length equal to 1, a matrix with 1 rows and tmax columns, or a matrix with 1 rows and 365 columns.

### Value

no return value

---

setup_aqua_trace	<i>Setup aquatic (immature) mosquito model with trace (forced) emergence</i>
------------------	--

---

### Description

Emergence is passed as a (possibly time varying) parameter which is decoupled from the adult mosquito dynamics. This module assumes  $l$  and  $p$  are equivalent, as emergence rates are given for  $p$ .

### Usage

```
setup_aqua_trace(model, lambda, stochastic)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
lambda	daily emergence of mosquitoes, may be time and patch varying, see <a href="#">time_patch_varying_parameter</a>
stochastic	should the model update deterministically or stochastically?

**Value**

no return value

---

setup_humans_MOI	<i>Setup humans with MOI (multiplicity of infection) pathogen model</i>
------------------	---

---

**Description**

This is a queueing model (M/M/inf) of superinfection in humans.

**Usage**

```
setup_humans_MOI(
  model,
  stochastic,
  theta,
  wf = NULL,
  H,
  MOI,
  b = 0.55,
  c = 0.15,
  r = 1/200,
  sigma = 1
)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
stochastic	should the model update deterministically or stochastically?
theta	a time spent matrix
wf	biting weights
H	vector of strata population sizes
MOI	a matrix giving the distribution of persons across strata (columns) and multiplicity of infection (rows).
b	transmission efficiency (mosquito to human)
c	transmission efficiency (human to mosquito)
r	recovery rate (inverse of infectious duration)
sigma	control non-independence of pathogen clearance; $\sigma > 1$ indicates competition (clearance is faster than independent) and $\sigma < 1$ indicates facilitation (clearance is slower than independent).

**Value**

no return value

**Note**

The [step\\_humans](#) method for the MOI model will grow the MOI matrix (add rows) if an individual's MOI exceeds the size of the matrix; therefore it's a good idea to pad the input matrix with extra empty rows to avoid reallocating memory during the simulation as much as possible.

---

setup_humans_SIP	<i>Setup humans with SIP pathogen model</i>
------------------	---

---

**Description**

A simple SIP (Susceptible-Infected-Protected) model

**Usage**

```
setup_humans_SIP(
  model,
  stochastic,
  theta,
  wf = NULL,
  SIP,
  b = 0.55,
  c = 0.15,
  r = 1/200,
  rho = 0.07,
  eta = 1/32
)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
stochastic	should the model update deterministically or stochastically?
theta	a time spent matrix
wf	biting weights
SIP	matrix of strata (rows) by health states (SIP)
b	transmission efficiency (mosquito to human)
c	transmission efficiency (human to mosquito)
r	recovery rate (inverse of infectious duration)
rho	probability of treatment upon infection
eta	rate at which prophylaxis decays

**Value**

no return value

---

setup_humans_SIR	<i>Setup humans with SIR infection model</i>
------------------	--

---

**Description**

A simple SIR (Susceptible-Infected-Recovered) model

**Usage**

```
setup_humans_SIR(  
  model,  
  stochastic,  
  theta,  
  wf = NULL,  
  H,  
  SIR,  
  b = 0.55,  
  c = 0.15,  
  gamma = 1/5  
)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
stochastic	should the model update deterministically or stochastically?
theta	a time spent matrix
wf	biting weights
H	vector of strata population sizes
SIR	a matrix giving S, I, R counts (columns) for each strata (rows)
b	transmission efficiency (mosquito to human)
c	transmission efficiency (human to mosquito)
gamma	rate of recovery

**Value**

no return value

---

setup\_humans\_SIS      *Setup humans with SIS pathogen model*

---

### Description

A simple SIS (Susceptible-Infected-Susceptible) model

### Usage

```
setup_humans_SIS(  
  model,  
  stochastic,  
  theta,  
  wf = NULL,  
  H,  
  X,  
  b = 0.55,  
  c = 0.15,  
  r = 1/200  
)
```

### Arguments

model	an object from <a href="#">make_MicroMoB</a>
stochastic	should the model update deterministically or stochastically?
theta	a time spent matrix
wf	biting weights
H	vector of strata population sizes
X	number of infectious persons in each strata
b	transmission efficiency (mosquito to human)
c	transmission efficiency (human to mosquito)
r	recovery rate (inverse of infectious duration)

### Value

no return value

---

setup_mosquito_BQ	<i>Setup blood feeding &amp; oviposition (BQ) behavioral state mosquito model</i>
-------------------	---

---

## Description

This is a behavioral state model which allows for time varying EIP and survival probability. Mosquitoes transition between blood feeding (B) and oviposition (Q) depending on the success (or not) of those biological activities. It complies with the mosquito component interface, and may be simulated deterministically or stochastically.

## Usage

```
setup_mosquito_BQ(
  model,
  stochastic,
  eip,
  pB,
  pQ,
  psiQ,
  Psi_bb,
  Psi_bq,
  Psi_qb,
  Psi_qq,
  nu = 25,
  M,
  Y
)
```

## Arguments

model	an object from <a href="#">make_MicroMoB</a>
stochastic	should the model update deterministically or stochastically?
eip	the Extrinsic Incubation Period (may be time varying see <a href="#">time_varying_parameter</a> )
pB	daily survival probability during blood feeding (may be time and patch varying see <a href="#">time_patch_varying_parameter</a> )
pQ	daily survival probability during oviposition (may be time and patch varying see <a href="#">time_patch_varying_parameter</a> )
psiQ	oviposition success probability (may be time and patch varying see <a href="#">time_patch_varying_parameter</a> )
Psi_bb	movement matrix from blood feeding haunts to blood feeding haunts (columns must sum to 1, p rows and columns)
Psi_bq	movement matrix from blood feeding haunts to aquatic habitats (columns must sum to 1, l rows and p columns)
Psi_qb	movement matrix from aquatic habitats to blood feeding haunts (columns must sum to 1, p rows and l columns)

Psi_qq	movement matrix from aquatic habitats to aquatic habitats (columns must sum to 1, 1 rows and columns)
nu	number of eggs laid per oviposition
M	number of susceptible mosquitoes (vector of length $p + 1$ )
Y	number of incubating mosquitoes (matrix with $p + 1$ rows and $\max\text{EIP} + 1$ columns)

**Value**

no return value

---

setup\_mosquito\_RM      *Setup generalized Ross-Macdonald mosquito model*

---

**Description**

This is a generalized RM model which allows for time varying EIP and survival probability. It complies with the mosquito component interface, and may be simulated deterministically or stochastically.

**Usage**

```
setup_mosquito_RM(
  model,
  stochastic,
  f = 0.3,
  q = 0.9,
  eip,
  p,
  psi,
  nu = 25,
  M,
  Y,
  Z,
  N = NULL
)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
stochastic	should the model update deterministically or stochastically?
f	the blood feeding rate
q	the human blood feeding fraction
eip	the Extrinsic Incubation Period (may be time varying see <a href="#">time_varying_parameter</a> )
p	daily survival probability (may be time and patch varying see <a href="#">time_patch_varying_parameter</a> )
psi	a mosquito dispersal matrix (rows must sum to 1)

nu	number of eggs laid per oviposition
M	total mosquito density per patch (vector of length p)
Y	density of incubating mosquitoes per patch (vector of length p)
Z	density of infectious mosquitoes per patch (vector of length p)
N	1 by p matrix describing how eggs from mosquitoes in patches are distributed amongst aquatic habitats. If NULL it is the identity matrix of dimension 1.

**Value**

no return value

---

setup\_mosquito\_trace    *Setup null mosquito model*

---

**Description**

This is a null model of mosquito dynamics that is only for testing/verifying aquatic models. It implements a single method [compute\\_oviposit.trace](#) and all other methods throw an error.

**Usage**

```
setup_mosquito_trace(model, oviposit)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
oviposit	a vector of length p used as a return value for <a href="#">compute_oviposit</a>

**Value**

no return value

---

setup\_visitor\_trace    *Setup trace driven visitors*

---

**Description**

This model complies with the visitors component interface. It adds a named list `model$visitor`.

**Usage**

```
setup_visitor_trace(model, Wd = NULL, xd = NULL)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
Wd	a time varying trace of visitor host availability passed to <a href="#">time_patch_varying_parameter</a> or NULL to set to 0 (no visitors)
xd	a time varying trace of visitor net infectiousness passed to <a href="#">time_patch_varying_parameter</a> or NULL to set to 0 (no visitors)

**Value**

no return value

---

set\_eip\_mosquito\_RM    *Set extrinsic incubation period for Ross-Macdonald mosquito model*

---

**Description**

Change the extrinsic incubation period parameter eip for some set of times. The new values eip should either be a scalar or a vector of length equal to the length of times.

**Usage**

```
set_eip_mosquito_RM(model, eip, times)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
eip	new extrinsic incubation period values
times	vector of times to set the new values

**Value**

no return value

---

set\_f\_mosquito\_RM      *Set feeding rate for Ross-Macdonald mosquito model*

---

**Description**

Change the feeding rate parameter  $f$ .

**Usage**

```
set_f_mosquito_RM(model, f)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
f	new blood feeding rate

**Value**

no return value

---

set\_kappa\_mosquito\_RM      *Set kappa for Ross-Macdonald mosquito model*

---

**Description**

Change kappa.

**Usage**

```
set_kappa_mosquito_RM(model, kappa)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
kappa	new value of kappa

**Value**

no return value

---

set\_K\_aqua\_BH                      *Set carrying capacity for Beverton-Holt aquatic mosquito model*

---

### Description

Change the carrying capacity parameter K for some times and places. The parameter K is stored internally as a matrix so that times and places are used to modify a submatrix, therefore the new value K should either be a scalar value to update the entire submatrix or a matrix of places rows and times columns.

### Usage

```
set_K_aqua_BH(model, K, times, places)
```

### Arguments

model	an object from <a href="#">make_MicroMoB</a>
K	new carrying capacity
times	vector of times to set the new values
places	vector of places to set the new values

### Value

no return value

---

set\_lambda\_aqua\_trace    *Set daily emergence for trace (forced) aquatic mosquito model*

---

### Description

Change the daily emergence parameter lambda for some times and places. The parameter lambda is stored internally as a matrix so that times and places are used to modify a submatrix, therefore the new value lambda should either be a scalar value to update the entire submatrix or a matrix of places rows and times columns.

### Usage

```
set_lambda_aqua_trace(model, lambda, times, places)
```

### Arguments

model	an object from <a href="#">make_MicroMoB</a>
lambda	new emergence
times	vector of times to set the new values
places	vector of places to set the new values

**Value**

no return value

---

set_molt_aqua_BH	<i>Set daily maturation probability for Beverton-Holt aquatic mosquito model</i>
------------------	--

---

**Description**

Change the daily maturation probability parameter `molt` for some times and places. The parameter `molt` is stored internally as a matrix so that `times` and `places` are used to modify a submatrix, therefore the new value `molt` should either be a scalar value to update the entire submatrix or a matrix of places rows and times columns.

**Usage**

```
set_molt_aqua_BH(model, molt, times, places)
```

**Arguments**

<code>model</code>	an object from <a href="#">make_MicroMoB</a>
<code>molt</code>	new daily maturation probability
<code>times</code>	vector of times to set the new values
<code>places</code>	vector of places to set the new values

**Value**

no return value

---

set_nu_mosquito_RM	<i>Set number of eggs laid per oviposition for Ross-Macdonald mosquito model</i>
--------------------	--

---

**Description**

Change the number of eggs laid per oviposition parameter `nu`.

**Usage**

```
set_nu_mosquito_RM(model, nu)
```

**Arguments**

<code>model</code>	an object from <a href="#">make_MicroMoB</a>
<code>nu</code>	new number of eggs laid per oviposition

**Value**

no return value

---

set\_psi\_mosquito\_RM     *Set mosquito dispersal matrix for Ross-Macdonald mosquito model*

---

**Description**

Change the mosquito dispersal matrix parameter `psi`.

**Usage**

```
set_psi_mosquito_RM(model, psi)
```

**Arguments**

<code>model</code>	an object from <a href="#">make_MicroMoB</a>
<code>psi</code>	new mosquito dispersal matrix

**Value**

no return value

---

set\_p\_mosquito\_RM     *Set daily survival probability for Ross-Macdonald mosquito model*

---

**Description**

Change the daily survival probability parameter `p` for some times and places. The parameter `p` is stored internally as a matrix so that `times` and `places` are used to modify a submatrix, therefore the new value `p` should either be a scalar value to update the entire submatrix or a matrix of `places` rows and `times` columns.

**Usage**

```
set_p_mosquito_RM(model, p, times, places)
```

**Arguments**

<code>model</code>	an object from <a href="#">make_MicroMoB</a>
<code>p</code>	new human blood feeding fraction
<code>times</code>	vector of times to set the new values
<code>places</code>	vector of places to set the new values

**Value**

no return value

---

set\_q\_mosquito\_RM      *Set human blood feeding fraction for Ross-Macdonald mosquito model*

---

**Description**

Change the human blood feeding fraction parameter  $q$ .

**Usage**

```
set_q_mosquito_RM(model, q)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
q	new human blood feeding fraction

**Value**

no return value

---

set\_surv\_aqua\_BH      *Set daily survival probability for Beverton-Holt aquatic mosquito model*

---

**Description**

Change the daily survival probability parameter  $surv$  for some times and places. The parameter  $surv$  is stored internally as a matrix so that  $times$  and  $places$  are used to modify a submatrix, therefore the new value  $surv$  should either be a scalar value to update the entire submatrix or a matrix of  $places$  rows and  $times$  columns.

**Usage**

```
set_surv_aqua_BH(model, surv, times, places)
```

**Arguments**

model	an object from <a href="#">make_MicroMoB</a>
surv	new daily survival probability
times	vector of times to set the new values
places	vector of places to set the new values

**Value**

no return value

---

step_aqua	<i>Update aquatic (immature) mosquito populations</i>
-----------	---

---

**Description**

This method dispatches on the type of `model$aqua`

**Usage**

```
step_aqua(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step_aqua.BH	<i>Update aquatic (immature) mosquito populations for Beverton-Holt dynamics</i>
--------------	--

---

**Description**

This function dispatches on the second class attribute of `model$aqua` for stochastic or deterministic behavior.

**Usage**

```
## S3 method for class 'BH'  
step_aqua(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

no return value

---

```
step_aqua.BH_deterministic
```

*Update aquatic (immature) mosquito populations for deterministic Beverton-Holt dynamics*

---

**Description**

Run a deterministic state update.

**Usage**

```
## S3 method for class 'BH_deterministic'  
step_aqua(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

```
step_aqua.BH_stochastic
```

*Update aquatic (immature) mosquito populations for stochastic Beverton-Holt dynamics*

---

**Description**

Run a stochastic state update.

**Usage**

```
## S3 method for class 'BH_stochastic'  
step_aqua(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step_aqua.trace	<i>Update aquatic (immature) mosquito populations for forced emergence</i>
-----------------	--

---

### Description

This function does nothing as trace models do not have endogenous dynamics.

### Usage

```
## S3 method for class 'trace'
step_aqua(model)
```

### Arguments

model            an object from [make\\_MicroMoB](#)

### Value

no return value

---

step_humans	<i>Update human population</i>
-------------	--------------------------------

---

### Description

This method dispatches on the type of model\$human.

### Usage

```
step_humans(model)
```

### Arguments

model            an object from [make\\_MicroMoB](#)

### Value

no return value

---

step_humans.MOI	<i>Update MOI human model</i>
-----------------	-------------------------------

---

**Description**

Update MOI human model

**Usage**

```
## S3 method for class 'MOI'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step_humans.MOI_deterministic	<i>Update MOI human model (deterministic)</i>
-------------------------------	---

---

**Description**

Update MOI human model (deterministic)

**Usage**

```
## S3 method for class 'MOI_deterministic'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

step\_humans.MOI\_stochastic

*Update MOI human model (stochastic)*

---

**Description**

Update MOI human model (stochastic)

**Usage**

```
## S3 method for class 'MOI_stochastic'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step\_humans.SIP

*Update SIP human model*

---

**Description**

Update SIP human model

**Usage**

```
## S3 method for class 'SIP'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step\_humans.SIP\_deterministic  
*Update SIP human model (deterministic)*

---

**Description**

Update SIP human model (deterministic)

**Usage**

```
## S3 method for class 'SIP_deterministic'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step\_humans.SIP\_stochastic  
*Update SIP human model (stochastic)*

---

**Description**

Update SIP human model (stochastic)

**Usage**

```
## S3 method for class 'SIP_stochastic'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step_humans.SIR	<i>Update SIR human model</i>
-----------------	-------------------------------

---

**Description**

Update SIR human model

**Usage**

```
## S3 method for class 'SIR'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step_humans.SIR_deterministic	<i>Update SIR human model (deterministic)</i>
-------------------------------	---

---

**Description**

Update SIR human model (deterministic)

**Usage**

```
## S3 method for class 'SIR_deterministic'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step\_humans.SIR\_stochastic  
*Update SIR human model (stochastic)*

---

**Description**

Update SIR human model (stochastic)

**Usage**

```
## S3 method for class 'SIR_stochastic'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step\_humans.SIS            *Update SIS human model*

---

**Description**

Update SIS human model

**Usage**

```
## S3 method for class 'SIS'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step\_humans.SIS\_deterministic  
*Update SIS human model (deterministic)*

---

**Description**

Update SIS human model (deterministic)

**Usage**

```
## S3 method for class 'SIS_deterministic'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step\_humans.SIS\_stochastic  
*Update SIS human model (stochastic)*

---

**Description**

Update SIS human model (stochastic)

**Usage**

```
## S3 method for class 'SIS_stochastic'  
step_humans(model)
```

**Arguments**

model            an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step_mosquitoes	<i>Update mosquito population</i>
-----------------	-----------------------------------

---

**Description**

This method dispatches on the type of `model$mosquito`

**Usage**

```
step_mosquitoes(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

no return value

---

step_mosquitoes.BQ	<i>Update blood feeding &amp; oviposition (BQ) behavioral state mosquitoes</i>
--------------------	--

---

**Description**

This function dispatches on the second argument of `model$mosquito` for stochastic or deterministic behavior.

**Usage**

```
## S3 method for class 'BQ'
step_mosquitoes(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Details**

see [step\\_mosquitoes.BQ\\_deterministic](#) and [step\\_mosquitoes.BQ\\_stochastic](#)

**Value**

no return value

---

step\_mosquitoes.BQ\_deterministic

*Update blood feeding & oviposition (BQ) behavioral state mosquitoes  
(deterministic)*

---

### Description

Update blood feeding & oviposition (BQ) behavioral state mosquitoes (deterministic)

### Usage

```
## S3 method for class 'BQ_deterministic'  
step_mosquitoes(model)
```

### Arguments

model            an object from [make\\_MicroMoB](#)

### Value

no return value

---

step\_mosquitoes.BQ\_stochastic

*Update blood feeding & oviposition (BQ) behavioral state mosquitoes  
(stochastic)*

---

### Description

Update blood feeding & oviposition (BQ) behavioral state mosquitoes (stochastic)

### Usage

```
## S3 method for class 'BQ_stochastic'  
step_mosquitoes(model)
```

### Arguments

model            an object from [make\\_MicroMoB](#)

### Value

no return value

---

step_mosquitoes.RM	<i>Update Ross-Macdonald mosquitoes</i>
--------------------	---

---

**Description**

This function dispatches on the second argument of `model$mosquito` to for stochastic or deterministic behavior.

**Usage**

```
## S3 method for class 'RM'  
step_mosquitoes(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Details**

see [step\\_mosquitoes.RM\\_deterministic](#) and [step\\_mosquitoes.RM\\_stochastic](#)

**Value**

no return value

---

step_mosquitoes.RM_deterministic	<i>Update Ross-Macdonald mosquitoes (deterministic)</i>
----------------------------------	---

---

**Description**

Update Ross-Macdonald mosquitoes (deterministic)

**Usage**

```
## S3 method for class 'RM_deterministic'  
step_mosquitoes(model)
```

**Arguments**

`model` an object from [make\\_MicroMoB](#)

**Value**

no return value

step\_mosquitoes.RM\_stochastic

*Update Ross-Macdonald mosquitoes (stochastic)*

---

### **Description**

Update Ross-Macdonald mosquitoes (stochastic)

### **Usage**

```
## S3 method for class 'RM_stochastic'  
step_mosquitoes(model)
```

### **Arguments**

model            an object from [make\\_MicroMoB](#)

### **Value**

no return value

---

step\_mosquitoes.trace *Update null mosquito population*

---

### **Description**

Update null mosquito population

### **Usage**

```
## S3 method for class 'trace'  
step_mosquitoes(model)
```

### **Arguments**

model            an object from [make\\_MicroMoB](#)

### **Value**

no return value

---

`strata_to_residency_counts`*Helper function for lumped population strata (counts)*

---

**Description**

If input is given as a matrix of population counts per strata (columns) and patch (rows), this function calculates the residency matrix and population size for the overall stratification of both residency and strata.

**Usage**

```
strata_to_residency_counts(H_counts)
```

**Arguments**

`H_counts` a matrix of population counts

**Value**

a [list](#) with three elements:

- J: the residency matrix mapping elements in H to patches
- H: the overall population distribution over strata and patches

**Examples**

```
# taken from package tests
J <- matrix(
  c(0.3, 0.5, 0.2,
    0.1, 0.6, 0.3), nrow = 3, ncol = 2, byrow = FALSE
)
H <- c(50, 60)
H_overall <- J %*% diag(H)
residency <- strata_to_residency_proportion(H_strata = H, J_strata = J)
```

---

`strata_to_residency_proportion`*Helper function for lumped population strata (proportional assignment)*

---

**Description**

If input is given as a vector of population sizes per-strata, lumped over patches, and a separate matrix whose columns describe how each strata is distributed over patches, this function calculates the residency matrix and population size for the overall stratification of both residency and strata.

**Usage**

```
strata_to_residency_proportion(H_strata, J_strata)
```

**Arguments**

H\_strata            a vector of population size by strata  
 J\_strata            a matrix whose columns sum to one giving the distribution of strata (columns)  
                       populations over patches (rows)

**Value**

a *list* with three elements:

- `assignment_indices`: provides a mapping from patch (rows) and strata (columns) into the "unrolled" vector H
- `J`: the residency matrix mapping elements in H to patches
- `H`: the overall population distribution over strata and patches

**Examples**

```
# taken from package tests
J <- matrix(
  c(0.3, 0.5, 0.2,
    0.1, 0.6, 0.3), nrow = 3, ncol = 2, byrow = FALSE
)
H <- c(50, 60)
# get the overall assignment of strata (cols) across patches (rows)
H_overall <- J %%% diag(H)
residency <- strata_to_residency_proportion(H_strata = H, J_strata = J)
```

---

time\_patch\_varying\_parameter

*Input parameters that may vary by time and patch*

---

**Description**

Input parameters that may vary by time and patch

**Usage**

```
time_patch_varying_parameter(param, p, tmax)
```

**Arguments**

param            if given a matrix, it must have nrows equal to p and ncols equal to either tmax  
                       or 365; if given a vector it must be of length p, tmax, or 365.  
 p                number of patches  
 tmax            number of time steps

**Value**

a matrix with p rows and tmax columns

---

time\_varying\_parameter

*Input parameters that may vary by time*

---

**Description**

Input parameters that may vary by time

**Usage**

time\_varying\_parameter(param, tmax)

**Arguments**

param	a vector of length 1, tmax, or 365.
tmax	number of time steps

**Value**

a vector with tmax elements
