Package 'datana'

September 7, 2024

Version 1.0.5

Date 2024-09-02

Title Datasets and Functions to Accompany Analisis De Datos Con R

Description Datasets and functions to accompany the book 'Analisis de datos con el programa estadistico R: una introduccion aplicada' by Salas-Eljatib (2021, ISBN: 9789566086109). The package helps carry out data management, exploratory analyses, and model fitting.

License GPL-3

`datana-package` *Datasets and Functions to Accompany Analisis De Datos Con R*

Description

The datana package provides the datasets and functions that accompany the book "Análisis de datos con el programa estadístico R: una introducción aplicada" by Salas-Eljatib (2021, ISBN: 9789566086109). You can visit the book's website at `https://eljatib.com/rlibro`.

Notice that every dataframe has a counterpart but has column names in Spanish. For instance, the dataframe 'crown' has column names in English, but 'crown2' has column names in Spanish. Both data frames have the same data.

Details

The package contains several datasets for exploratory data analysis in an array of disciplines. Furthermore, datana provides functions as tools for descriptive statistics and plotting.

To see the preferable citation of the package, type citation("datana").

Author(s)

Christian Salas-Eljatib [aut, cre] (<https://orcid.org/0000-0002-8468-0829>), Pino Nicolas [ctb] (up to 2020), Riquelme Joaquin [ctb] (up to 2020)

Maintainer: Christian Salas-Eljatib <cseljatib@gmail.com>

Christian Salas-Eljatib is also indebted to several people who have contributed to individual data frames and functions: see credits in help pages.

Examples

```
##scatter-plot and marginal histograms
data(treevolroble)
df <- treevolroble
xyhist(x=df$dbh,y=df$toth, xlab="Variable X",  ylab="Variable Y")

##scatter-plot and box-plots
data(fishgrowth)
df <- fishgrowth
xyboxplot(x=df$length,y=df$scale)
```

---

aboutrsq *About the R-Squared statistics: the Anscombe quartet dataset*

Description

A dataset that contains four pairs of columns with the same descriptive statistics; however, there is a difference when representing the points through a graph.

Usage

```
data(aboutrsq)
```

Format

The data frame contains four variables as follows:

X1 Integers values that represent X-axis for Y1, Y2 and Y3 column

Y1 Float values that represent Y-axis for X1 column

Y2 Float values that represent Y-axis for X1 column

Y3 Float values that represent Y-axis for X1 column

X2 Integers values that represent X-axis for Y4 column

Y4 Float values that represent Y-axis for X2 column

Source

Data were assembled by Dr Christian Salas-Eljatib (Santiago, Chile).

```

`aboutrsq2` *Sobre el estadístico R2: los datos del cuarteto de Anscombe*

Description

Dataset que contiene cuatro pares de columnas con la mismos estadísticos descriptivos, sin embargo, si existe diferencia al representar los puntos mediante un gráfico.

Usage

```
data(aboutrsq2)
```

Format

Variables se describen a continuación::

X1 Valores enteros que representan el eje X para las columnas Y1, Y2 e Y3

Y1 Valores flotantes que representan el eje Y para la columna X1

Y2 Valores flotantes que representan el eje Y para la columna X1

Y3 Valores flotantes que representan el eje Y para la columna X1

X2 Valores enteros que representan el eje X para las columnas Y4

Y4 Valores flotantes que representan el eje Y para la columna X2

Source

Datos fueron contribuidos por el Prof. Christian Salas-Eljatib (Universidad de Chile, Santiago, Chile).

`airnyc` *Airquality data in New York city.*

Description

Daily air quality measurements in New York, May to September 1973.

Usage

```
data(airnyc)
```

Format

Contains 6 variables, as follows:

ozone numeric Ozone (ppb).

solar numeric Solar R (lang).

wind numeric Wind (mph).

temp numeric Temperature (degrees F).

month numeric Month (1–12).

day numeric Day of month (1–31).

Source

The data were obtained from the library 'datasets'.

References

Examples

```
data(airnyc)
head(airnyc)
```

airnyc2 *Calidad del aire en la ciudad de Nueva York.*

Description

Calidad del aire diario medido en New York, de Mayo a Septiembre de 1973.

Usage

```
data(airnyc2)
```

Format

Contiene 6 variables:

ozone Ozono (ppb).

solar Solar R (largo).

wind Viento (mph).

temp Temperatura (grados F).

month Mes del año (1–12).

day Dia del mes (1–31).

Source

Los datos fueron obtenidos desde la librería 'datasets'.

```

annualppCities *Time series of annual precipitations in cities of Chile.*

Description

Data contains annual precipitations in six cities in Chile (Santiago, Talca, Chillan, Temuco, Valdivia, and Puerto Montt) at different years.

Usage

```
data(annualppCities)
```

Format

The dataframe contains three variables as follows:

city Name of city.

year Year of registry.

annual Value of the annual precipitation of a given year (mm).

Source

The data were obtained from https://explorador.cr2.cl/.

Examples

```
data(annualppCities)

```

---

araucaria *Contains plot-level variables in Araucaria araucana forests in southern Chile.*

Description

These are plot-level measurement data from the Araucaria araucana forests in southern Chile, measured in 2009. The data was based on fixed-area plots of 1000 m^2. They are two forest stands.

Usage

```
data(araucaria)
```

Format

Contains plot-level variables as follows:

stand Stand number

plot.no Plot sample identificator number

x.utm UTM coordinate in X-axis, in km

y.utm UTM coordinate in Y-axis, in km

slope Slope, in %

aspect Aspect, in degrees

eleva Elevation, in msnm

nha Tree density, in trees/ha

gha Basal area, in m^2/ha

hdom Dominant height, in m

vha Gross stand volume, m^3/ha

dg Diameter of the average basal area tree of the plot, in cm

Source

The data are provided courtesy of Dr Nelson Ojeda at Universidad de La Frontera (Temuco, Chile).

```

`araucaria2` *Variables a nivel de parcela para bosques de Araucaria araucana el sur de Chile.*

Description

Estos son variables a nivel de parcela para bosques Araucaria araucana en el sur de Chile, medidos en 2009. Estas variables se basan en mediciones realizadas en parcelas de muestreo de superficie fija de 1000 m^2. Hay dos rodales.

Usage

```
data(araucaria)
```

Format

Contains plot-level variables as follows:

rodal Stand number

parcela Plot sample identificator number

x.utm UTM coordinate in X-axis, in km

y.utm UTM coordinate in Y-axis, in km

pendiente Slope, in %

exposicion Aspect, in degrees

altitud Elevation, in msnm

nha Densidad, en arb/ha

gha Area basal, en m^2/ha

hdom Altura dominante, en m

vha Volumen bruto, en m^3/ha

dg Diameter medio cuadratico, en cm

Source

baiTreelines *Annual basal area increment for four tree species.*

Description

The dataset contains 157 observations of the last ten years in 6-8 adult trees of different species at three elevations of altitudinal gradients sampled in four locations in Chile and two in Spain.

Usage

```
data(baiTreelines)
```

Format

Contains seven columns, as follows:

climate Climate of each location, mediterranean and temperate.

site Name of Location of study (termmas:Termas de Chillan , antillanca:Antillanca area within Puyehue National Park, castillo:Cerro Castillo Natural Reserve, farellones:Farellones in Central Chile, pyrenees: Sierra de Cutas area in Spanish Central Pyrenees,sierra:Sierra Nevada).

species name species of study (lenga: Nothofagus pumilio, frangel: Kageneckia angustifolia, uncinata: Pinus uncinata, sylvestris: Pinus sylvestris).

elevation Type of elevation. "Treeline", intermediate named as "inter", and closed or montane forest named as low.

tree Id for tree.

bai Value of annual basal area increment.

mean.bai Mean of annual basal area increment.

Source

The data were obtained from the DRYAD repository at doi:10.5061/dryad.ks97h.

References

```

`baiTreelines2` *Incremento anual en area basal de cuatro especies arboreas.*

Description

Este set de datps contiene 157 observaciones, de los ultimos 10 años en 6-8 árboles adultos de cuatro especies en un gradiente altitudinal. Las muestras se distribuyeron en cuatro localidades o sitios de Chile y dos en España.

Usage

```
data(baiTreelines2)
```

Format

Contains seven columns, as follows:

clima Climate of each location, mediterranean and temperate.

sitio Name of Location of study (termmas:Termas de Chillan , antillanca:Antillanca area within Puyehue National Park, castillo:Cerro Castillo Natural Reserve, farellones:Farellones in Central Chile, pyrenees: Sierra de Cutas area in Spanish Central Pyrenees,sierra:Sierra Nevada).

especie name species of study (lenga: Nothofagus pumilio, frangel: Kageneckia angustifolia, uncinata: Pinus uncinata, sylvestris: Pinus sylvestris).

tipo.altitud Type of elevation. "Treeline", intermediate named as "inter", and closed or montane forest named as low.

arbol Id for tree.

bai Value of annual basal area increment.

bai.medio Mean of annual basal area increment.

Source

The data were obtained from the DRYAD repository at doi:10.5061/dryad.ks97h.

`bears` *Age and physical measurement data for wild bears*

Description

Wild bears were anesthetized, and their bodies were measured and weighed. One goal of the study was to make a table (or perhaps a set of tables) for people interested in estimating the weight of a bear based on other measurements. Notice that there are missing values for some of the variables.

Usage

```
data(bears)
```

Format

Contains individual-level variables, as follows:

id Bear id

age Age in total number of months.

month Month number within a given year.

sex 1 =male, 2 = female.

headL Length of head, in cm.

headW Width of head, in cm.

neckG Girth of neck, in cm.

length Body length, in cm.

chestG Girth of chest, in cm.

weight body weight, in kg.

obs Temporal observation number for bear.

name Name given to bear.

Source

According to Prof. Timothy Gregoire at Yale University (New Haven, CT, USA), the data set was supplied by Gary Alt.

References

Entertaining references are in Reader's Digest April, 1979, and Sports Afield September, 1981.

Examples

```
data(bears)
head(bears)
table(bears$sex)
boxplot(headL~sex, data=bears)
```

---

bears2 *Edad y características biométricas de osos salvajes*

Description

Los osos salvajes fueron anestesiados y sus cuerpos medidos. Uno de los objetivos del estudio fue hacer una tabla (o quizas un conjunto de tablas) para las personas interesadas en estimar el peso de un oso basandose en otras medidas. Observe que faltan valores para algunas de las variables.

Usage

```
data(bears2)
```

Format

Contiene variables de nivel individual, como se describen a continuacion:

id Identificador del oso

edad edad en meses

mes Diámetro a la altura del pecho, en cm

sexo 1 = hombre, 2 = mujer

cabezaL longitud de la cabeza, en cm

cabezaA ancho de la cabeza, en cm

cuelloP circunferencia del cuello, en cm

largo longitud del cuerpo, en cm

pechoG circunferencia del pecho, en cm

peso peso corporal, en kg

obs número de observación temporal para el oso

nombre nombre dado al oso

Source

Segun el Prof. Timothy Gregoire de Yale University (New Haven, CT, USA), los datos fueron cedidos por Gary Alt. Minitab, Inc. La descripcion de los datos fue dada por él.

References

Algunas referencias generales estan en el Reader's Digest de Abril, 1979, y Sports Afield de Septiembre, 1981.

---

beetles *Population density growth of beetles*

Description

Temporal measurements of density of beetles (Tribolium confusum) growing in different controlled environments.

Usage

```
beetles
```

Format

days Number of days.

diet The quantities of flour (in grams) of the environments where the beetles were growing. Six levels of the factor Diet.

type The various stage of beetles, i.e., eggs, larvae, pupae, and adults.

density The number of insects per environment.

Source

Data from Table No. 1, page 116, of Chapman (1928). Series of experiments under controlled conditions in which flour beetles (Tribolium confusum) are kept in environments of known size. The period from egg to adult is approximately forty days at 27C degrees. The data were entered by Yamara Arancibia, a former student of Prof. Christian Salas-Eljatib.

---

beetles2 *Crecimiento poblacional de escarabajos*

Description

Mediciones temporales de densidad de escarabajos (Tribolium confusum) creciendo en diferentes ambientes controlados.

Usage

```
beetles2
```

Format

dias Número de dias.

dieta La cantidad de harina (en gramos) de ambientes donde crecen los escarabajos. Seis niveles del factor Dieta.

tipo Estados de desarrollo de los escarabajos, i.e., huevos, larvas, pupas, y adultos.

densidad Número total de individuos por ambiente de crecimiento.

Source

Datos del Cuadro No. 1, page 116, de Chapman (1928). Serie de experimentos bajo condiciones controladas donde escarabajos (Tribolium confusum) se mantienen en ambientes de tamaño conocido. El periodo desde huevo a adulto es de aproximadamente de cuarenta dias a 27 grados Celsius. Los datos fueron digitados por Yamara Arancibia, una estudiante del Prof. Christian Salas-Eljatib.

carbohydrateTreelines *Carbohydrates concentrations of tree species.*

Description

Dataset contains 863 observations, about of total soluble carbohydrate, starch, and non structural carbohydrates concentrations per mass unit and per volume unit, in three tissues in early summer and early autumn 6-8 adult trees of different species at three elevations of altitudinal gradients sampled in four locations of Chile and Spain.

Usage

```
data(carbohydrateTreelines)
```

Format

Contains 16 variables, as follows:

climate Climate of each location, mediterranean and temperate.

site Name of Location of study (termas:Termas de Chillan , antillanca:Antillanca area within Puyehue National Park, castillo:Cerro Castillo Natural Reserve, farellones:Farellones in Central Chile, pyrenees: Sierra de Cutas area in Spanish Central Pyrenees,sierra:Sierra Nevada).

species name species of study (lenga: Nothofagus pumilio, frangel: Kageneckia angustifolia, uncinata: Pinus uncinata, sylvestris: Pinus sylvestris).

tissue Type of tissue, new developing twings, stem sapwood and branches.

time Meauserement season (spring or autumn).

elevation Type of elevation. "Treeline", intermediate named as "mid", and closed or montane forest named as "low".

tree Id for tree.

tree.site Id site for each location of study.

tss Value of concentrations soluble carbohydrate per mass unit.

st Value of concentrations starch per mass unit.

nsc Value of concentrations non structural carbohydrates per mass unit.

tss.nsc .

wd It might be 'wood density', but not sure.

tss.mv Value of concentrations soluble carbohydrate per volume unit.

st.mv Value of concentrations starch per volume unit.

nsc.mv Value of concentrations non structural carbohydrates per volume unit.

Source

The data were obtained from the DRYAD repository at doi:10.5061/dryad.ks97h.

```

cdf *Computes the cumulative distribution for a given random variable*

Description

Cumulative distribution for a given random variable.

Usage

```
cdf(y = y)
```

Arguments

y	a vector of a random variable

Details

The cumulative distribution of the random variable is build every 5 the data at hand, that is to say, from 0.05 (i.e., 5

Value

The function returns a dataframe having two columns: the first contains the random variable values and the second the cumulative distribution for the variable.

Author(s)

Christian Salas-Eljatib

Examples

```
y.var <- rnorm(10)
cdf(y.var)
```

chicksw *Chicken growth data.*

Description

The body weights of the chicks were measured at birth and every second day thereafter until day 20. They were also measured on day 21. There were four groups on chicks on different protein diets.

Usage

```
data(chicksw)
```

Format

Contains four variables, as follows:

weight A numeric vector giving the body weight of the chick (gm).

time A numeric vector giving the number of days since birth when the measurement was made.

chick An ordered factor with levels different giving a unique identifier for the chick. The ordering of the levels groups chicks on the same diet together and orders them according to their final weight (lightest to heaviest) within diet.

diet A factor with levels 1,2,3 and 4 indicating which experimental diet the chick received.

Source

The data were obtained from the alr4 library.

References

Crowder M, Hand D. 1990. Analysis of Repeated Measures. Chapman and Hall

Examples

```
data(chicksw)
head(chicksw)
```

`contrast` *Computes statistics for inference in a given contrast*

Description

The function computes the statistics for inference in a given contrast, subject to a given significance level. Those statistics are as follows: estimated contrast, standard error of the contrast, and confidence interval of the contrast.

Usage

```
contrast(
  model = model,
  coef.cont = coef.cont,
  grp.m = grp.m,
  grp.n = grp.n,
  alpha = 0.05,
  full = TRUE
)
```

Arguments

model	object containing the fitted model
coef.cont	vector with the coefficients to establish the contrasts
grp.m	a vector having the sample mean per each group, or level of the factor under study.
grp.n	a vector having the sample size per each group, or level of the factor under study.
alpha	is the significance level for building the confidence intervals. Default value is 0.05, which is 95% confidence level.
full	FALSE if want short output, TRUE for longer (i.e. more details). Default is TRUE.

Details

The contrast is established based upon an already fitted statistical model that describe the relationship among variables. The significance level (alpha) is defined by the user, although by default has been set to 0.05, that is to say, a 95 statistical confidence.

Value

This function returns the above described statistics for a given contrast.

corkoak *Tree-level cork biomass data for Oak trees in Portugal*

Description

Measurements of cork weight in sample trees of Quercus suber (Oak) in Portugal.

Usage

```
corkoak
```

Format

tree A correlative number for each sample tree.

csc is tree circumference at 1.3 m outside bark, in cm.

cbc is tree circumference at 1.3 m under bark, in cm.

bt bark thickness, in cm.

hdeb is debarking height, in m.

hblc height to base of live crown, in m.

nb number of branches debarked

cr.diam crown diameter, in m.

w total green weight of the stripped cork, in kg

stratum Stratum

Source

Data supplied electronically to Prof. Timothy Gregoire (Yale University) by authors accompanied by a note which said "After the article was published we discovered a problem with 2 of the observations so Teresa and I decided it was best just to delete them."

`crown` *Tree crown radii*

Description

Crown radii measurements in cardinal directions for sample trees at the Rucamanque experimental forest, near Temuco, Chile. Data were collected within a sample plot of 250 m^2, located in a secondary forest stand dominated by Nothofagus obliqua.

Usage

```
data(crown)
```

Format

Contains of variables, as follows:

spp Species code. 'Ro' is Nothofagus obliqua (roble), 'Co' is Nothofagus dombeyi (Coigue) and 'Ol' is Olivillo.

dbh Diameter at breast height, in cm.

toth Total height, in m.

crad.n Crown radii towards the north, in m.

crad.e Crown radii towards the east, in m.

crad.s Crown radii towards the south, in m.

crad.w Crown radii towards the west, in m.

x.coord Cardinal position at the X-axis, in m.

y.coord Cardinal position at the Y-axis, in m.

cr.diam Crown diameter, in m.

`deadForestCA` *Data contains climatic, forest structure and forest mortality variable*

Description

The data file contains one row per unique 3.5km grid cell by year combination. The data frame covers all grid cells within the state of California where at least one Aerial Detection Survey (ADS) flight was taken between 2009 and 2015, so each grid cell position has between 1 and 7 years of data (reflected as 1 to 7 rows in the data file per grid cell position). The main response variables are mort.bin (presence of any mortality) and mort.tph (number of dead trees/ha within the given grid cell by year).

Usage

```
data(deadForestCA)
```

Format

The data frame contains four variables as follows:

live.bah Live basal area from the GNN dataset

live.tph Live trees per hectare from the GNN dataset

pos.x rank-order x-position of the grid cell (position 1 is western-most)

pos.y rank-order y-position of the grid cell (position 1 is northern-most)

alb.x x-coordinate of the grid cell centroid in California Albers (EPSG 3310)

alb.y y-coordinate of the grid cell centroid in California Albers (EPSG 3310)

mort.bin 1= dead trees observed in grid cell. 0= no dead trees observed

mort.tph Dead trees per hectare from the aggregated ADS dataset

mort.tpa Dead trees per acre from the aggregated ADS dataset

year Year of the ADS flight. Most flights occurred from May-August.

Defnorm Mean annual climatic water deficit for the grid cell, for Oct 1-Sept 31 water year, averaged from 1981-2015

Def0 Climatic water deficit for the grid cell during the Oct-Sept water year overlapping the summer ADS flight of the given year

Defz0 Z-score for climatic water deficit for the given grid cell/water year. Calculated as (Def0-Defnorm)/(standard deviation in deficit among all years 1981-2015 for the given grid cell)

Defz1 Z-score for climatic water deficit for the given grid cell in the preceeding water year.

Defz2 Z-score for climatic water deficit for the given grid cell two water years prior.

Tz0 Z-score for temperature for the given grid cell/year.

Pz0 Z-score for precipitation for the given grid cell/year.

Defquant FDCI variable. Quantile of Defnorm of the given grid cell, relative to the Defnorm of all other grid cells with a basal area within 2.5 m^2/ha of the given cell is basal area.

Source

The data were provided from DRYAD repository.

```

`deadForestCA2` *Los datos contienen variables climaticas, de estructura forestal y de mortalidad forestal.*

Description

El archivo de datos contiene una fila por combinacion unica de celda de cuadricula de 3,5 km por año. El marco de datos cubre todas las celdas de la cuadricula dentro del estado de California donde se tomo al menos un vuelo de la Encuesta de deteccion aerea (ADS) entre 2009 y 2015, por lo que cada posicion de celda de la cuadricula tiene entre 1 y 7 años de datos (reflejados como 1 a 7 filas en el archivo de datos por posicion de celda de cuadricula). Las principales variables de respuesta son mort.bin (presencia de alguna mortalidad) y mort.tph (número de árboles muertos /ha dentro de la celda de la cuadricula por año).

Usage

```
data(deadForestCA2)
```

Format

Variables se describen a continuacion::

live.bah Area basal viva del conjunto de datos GNN

live.tph Árboles vivos por hectarea del conjunto de datos GNN

pos.x posicion x del orden de clasificacion de la celda de la cuadricula (la posicion 1 es la mas occidental)

pos.y posicion y del orden de clasificacion de la celda de la cuadricula (la posicion 1 es la mas al norte)

alb.x coordenada x del centroide de la celda de la cuadricula en California Albers (EPSG 3310)

alb.y coordenada y del centroide de la celda de la cuadricula en California Albers (EPSG 3310)

mort.bin 1 = árboles muertos observados en la celda de la cuadricula. 0 = no se observaron árboles muertos

mort.tph Árboles muertos por hectarea del conjunto de datos ADS agregado

mort.tpa Árboles muertos por acre del conjunto de datos ADS agregado

year año del vuelo de ADS. La mayoría de los vuelos se realizaron entre mayo y agosto

Defnorm Deficit hidrico climatico anual medio para la celda de la cuadricula, para el año hidrico del 1 de octubre al 31 de septiembre, promediado de 1981 a 2015

Def0 Deficit de agua climatica para la celda de la cuadricula durante el año hidrologico de octubre a septiembre que se superpone al vuelo ADS de verano del año dado

Defz0 Puntaje Z para el deficit hidrico climatico para la celda de cuadricula / año hidrico dado. Calculado como (Def0-Defnorm) / (desviacion estandar en el deficit entre todos los años 1981-2015 para la celda de la cuadricula dada

Defz1 Puntuacion Z para el deficit h?drico climatico para la celda de la cuadricula dada en el año hidrologico anterior.

Defz2 Puntuacion Z para el deficit hidrico climatico para la celda de la cuadricula dada dos años antes.

Tz0 Puntaje Z para la temperatura para la celda de cuadricula / año dado.

Pz0 Puntaje Z para la precipitacion para la celda / año de la cuadricula dado.

Defquant Variable FDCI. Cuantil de Defnorm de la celda de la cuadricula dada, en relacion con la Defnorm de todas las demas celdas de la cuadricula con un area basal dentro de 2.5 m^2/ha de la celda dada

Source

`deadLianas` *This dataset has 43 columns and 4247 rows. Each row corresponds to an epiphyte individual located on the reliable sections of the host trees*

Description

This study is part of the project "Diversity and dynamics of vascular epiphytes in Colombian Andes" supported by COLCIENCIAS (contract 2115-2013). The data corresponds to the first large-scale assessment of vascular epiphyte mortality in the neotropics. Based on two consecutive annual surveys, we followed the fate of 4247 epiphytes to estimate the epiphyte mortality rate on 116 host trees at nine sites. Additional variables were taken from the area of study in order to find relationships with epiphyte mortality.

Usage

```
data(deadLianas)
```

Format

The data frame contains four variables as follows:

PlotSite Municipality name of the 9 study sites

Y.Plot Latitude of the plot in decimal degrees

X.Plot Longitude of the plot in decimal degrees

PhoroNo ID number of the sampled host trees in each site

EpiFam Epiphyte taxonomic family

EpiGen Epiphyte taxonomic genus

cf.aff Abbreviations of Latin terms in the context of taxonomy. cf. "confer" meaning "compare with". aff.: "affinis" meaning "similar to".

Species Epiphyte (morpho) species name

Author Author of the scientific name

EpiAzi Azimuth of the epiphyte individual on each host tree

BraAzi Azimuth of the branch in which the epiphyte individual was found

EpiDisTru Distance in meters from the trunk to the epiphyte attachment site on a branch

EpiSize Estimated size of the epiphyte individual in centimetres

EpiAttHei Epiphyte attachment height in meters

Date0 Date of the first census

Date1 Date of the final census

Location Section (roots, trunks, branches) of the host tree in which theepiphyte individual was found

Mortality Dichotomous variable. 0 if the epiphyte individual was dead in the final census and 1 if otherwise

MorCat Mechanical or non-mechanical cause of mortality

Elevation Elevation (m a.s.l.) of the plot

AP_bio12 Annual precipitation in the plot (mm yr-1)

PDM_bio14 Precipitation of driest month in the plot (mm)

PS_bio15 Precipitation seasonality in the plot (coefficient of variation)

MDT_bio2 Mean Diurnal Range (Mean of monthly (max temp - min temp)) in the plot (oC*10)

TS_bio4 Temperature seasonality in the plot (standard deviation*100)

ATR_bio7 Annual temperature range in the plot (10 celsius degrees)

AET Actual evapotranspiration in the plot (mm yr-1)

BasAre Basal area of trees with DBH major or equal to 5 cm (AB) in the plot (m^2/ha)

BasAre5_10 Basal area of trees with greater or equal than 5 DBH and less than 10 cm in the plot (m^2/ha)

BasAre10 Basal area of trees with greater or equal than 10 cm DBH in the plot (m^2/ha)

Ind10 Number of canopy trees (with greater or equal than 10 cm DBH) in the plot

Ind5 Number of understory trees (with greater or equal than 5 DBH and less than 10 cm) in the plot

Ind5_10 Number of trees with greater or equal than 5 DBH and less than 10 cm in the plot

Ind10_15 Number of trees with greater or equal than 10 DBH and less than 15 cm in the plot

Ind15_20 Number of trees with greater or equal than 15 DBH and less than 20 cm in the plot

Ind20_25 Number of trees with greater or equal than 20 DBH and less than 25 cm in the plot

Ind25_30 Number of trees with greater or equal than 25 DBH and less than 30 cm in the plot

Ind30 Number of trees with DBH major or equal to 30 cm in the plot

TreeHei Total tree height in meters

MedHei Median height of trees in each plot

MaxHei Maximum height of trees in each plot

BranchNumb Number of branches of the host tree

deleteRight *Deletes the last n-characters of a string*

Description

Function to delete the last n-characters of a string from the right-hand side.

Usage

```
deleteRight(fac, n)
```

Arguments

fac	is an object of class string or factor
n	is the number of characters to be deleted of a the string given in 'fac'.

Details

It is specially set to arrange data vector having alphanumeric format.

Value

This function returns an object having n-less characters from the right-hand side.

Author(s)

Christian Salas-Eljatib

Examples

```
last.names.id <- c("Stage-1924","Gregoire-1958","Robinson-1967")
deleteRight(last.names.id,5)
deleteRight(last.names.id,4)
```

demograph *Contains information of demography of species.*

Description

Dataset contains 61 observations about life histories values for each species and site, as obtained from the parameterization carried out in studies that used the model SORTIE

Usage

```
data(demograph)
```

Format

Contains 15 variables, as follows:

sp Name specie.

site Name of site of study.

country Name of country.

site.n Code of site.

code Code of specie.

genus Genus of specie.

sps Abbreviated name specie.

family Family of specie.

phyl Type of phylogeny.

l.hab Type of leaf habit.

l.type .

leaf Type of leaf.

growth.l Growth at full light (time in years).

growth.d Growth in shade.

surv.d Survival in shade.

Source

The data were obtained from the DRYAD repository.

References

descstat *Creates a descriptive statistics table for continuous variables*

Description

Function to create a descriptive statistics table for continuous variables from a dataframe.

Usage

```
descstat(data = data, decnum = 4, full = FALSE)
```

Arguments

data	a dataframe containing numeric variables as columns.
decnum	the number of decimals to be used in the output.
full	TRUE for a longer output (i.e. more descriptive statistics). The default is to FALSE.

Details

The resulting table offers the main central and dispersion statistics.

Value

This function wraps descriptive statistics into a summarize table having the following descriptive statistics: sample size, minimum, maximum, mean, median, SD, and coefficient of variation. If the full option is set to TRUE, the following statistics are added to the table: 25th and 75th percentiles, the interquartile range, skewness, and kurtosis.

Author(s)

Christian Salas-Eljatib and Tomas Cayul.

Examples

```
#creating a ficticiuos dataframe
set.seed(1234)
df <- as.data.frame(cbind(variable1=rnorm(5, 0), variable2=rnorm(5, 2)))
## adding one missing value
df[3,1] <- NA
df
#' #using the function
descstat(data=df)
descstat(data=df,decnum=1)
descstat(df,2)
```

election *Presidential election data of Florida (USA) in 2000.*

Description

County-by-county vote for president in Florida in 2000 for Bush, Gore and Buchanan.

Usage

```
data(election)
```

Format

Contains three variables, as follows:

gore Vote for Gore.

bush Vote for Bush.

buchanan Vote for Pat Buchanan.

Source

The data were obtained from the 'alr4' library.

`eucaleafAll2` *Mediciones foliares (todas, n=744) para árboles de Eucalyptus nitens en Tasmania, Australia.*

Description

Mediciones de largo, ancho y area de hojas de Eucalyptus nitens para toda la muestra de Candy (1999).

Usage

```
data(eucaleafAll2)
```

Format

Contiene variables a nivel de hoja, como sigue:

tiempo factor a dos niveles: Temprano o Tardio

arbol un identificador del árbol muestra

meristema descripcion del meristema

largo largo de la hoja, en mm

ancho ancho de la hoja, en mm

area area foliar, en cm^2

Source

Aunque la fuente original de estas mediciones proviene de la tesis del Dr. Candy (1999), el archivo de datos fue cortesia del Prof. Timothy Gregoire de Yale University (New Haven, CT, USA).

eucaplot — *Data from a Eucalyptus globulus plantation near Gorbea, Region de La Araucania, Chile.*

Description

Tree-level data collected within a sample plot in a forestry plantation of Eucalyptus globulus near Gorbea, Southern Chile. The plot size is 500 m^2. The plantation is 15 yr-old and had been subject to three thinnings.

Usage

```
data(eucaplot)
```

Format

The dataframe contains four variables as follows:

dbh Diameter at breast height, in cm.

health health status (1: good, 2: medium, 3: bad).

shape stem shape for timber purposes (1: good, 2: medium, 3: bad).

crown.class Crown class (1: superior, 2: intermedium, 3: lower).

toth Total height, in m.

Source

The data were provided courtesy of Dr Christian Salas (Universidad de Chile, Santiago, Chile).

```

ficdiamgr *Diameter growth of trees*

Description

The 'ficdiamgr' is a fictitious dataframe built to show the structure of longitudinal data. The dataframe has records of tree diameter growth of five sample trees, spanning three species.

Usage

```
data(ficdiamgr)
```

Format

A time series data containing the following columns:

tree.id an ordered factor indicating the tree on which the measurement is made. The ordering is according to increasing maximum diameter.

time a numeric vector giving the numbers of days since establishment.

dbh a numeric vector of diameter at breast height, in cm.

site a factor variable, representing site conditions with two levels.

spp a factor variable, representing tree species with three levels.

Source

This dataframe was built from the 'Orange' data of the 'datasets' package, by Christian Salas-Eljatib.

Examples

```
data(ficdiamgr)

coplot(dbh ~ time | tree, data = ficdiamgr, show.given = FALSE)
```

ficdiamgr2 *Crecimiento diametral de árboles*

Description

Los datos 'ficdiamgr2' son ficticios, y fue construida para mostrar la estructura de datos longitudinales. Los datos tienen registro de crecimiento en cinco árboles muestra, representando a tres especies.

Usage

```
data(ficdiamgr2)
```

Format

Una serie de tiempo conteniendo las siguientes columnas:

arbol indica el identificador del árbol.

tiempo número de dias desde el inicio de las mediciones.

dap diámetro a la altura del pecho, en cm.

sitio un factor, representando condiciones de sitio, en dos niveles.

espe un factor, representando especie del árbol, en tres niveles.

Source

Estos datos fueron modificados desde la dataframe 'Orange' de la librería 'datasets', por Christian Salas-Eljatib.

Examples

```
data(ficdiamgr2)

coplot(dap ~ tiempo | arbol, data = ficdiamgr2, show.given = FALSE)
```

---

findColumn.byname *Finds the position of a specific variable.*

Description

Sometimes in data manipulation we face the task of locating the position of a specific variable within a dataframe. The function finds the position in which a column name is within an object.

Usage

```
findColumn.byname(data = data, col.name = col.name)
```

Arguments

`data`	is a dataframe
`col.name`	is a string specifying the name of the variable

Details

Although the function finds the position of a specific variable, can also be used for more than one variable.

Value

This function returns the number of a specific column-name.

Note

It can be used for a vector of specified column-names as well.

Author(s)

Christian Salas-Eljatib

Examples

```
df <- data.frame(varX=1:5, varY=letters[1:5], varZ=rep("a",5), varK=rep("b",5))
df
#using the function
findColumn.byname(df, c("varY","varZ"))
findColumn.byname(df, "varK")
#Creating an example vector
vector <- letters
vector
findColumn.byname(vector, c("h","z"))
```

`forestFire` *Data of forest fire occurrence*

Description

Data of forest fire occurrence from Altamirano et al. (2013) as our population, containing 7210 total observations (N), with only 890 cases of fire occurrence (N 1) and 6320 cases of non occurrence (N 0). The binary variable (Y) is the occurrence of forest fire, where Y equal to 1 denotes occurrence and Y equal to 0 otherwise.

Usage

```
data(forestFire)
```

Format

The data frame contains four variables as follows:

fire Presence of forest fire (1 yes, 0 no)
xcoord Geographic coordinate x.utm
ycoord Geographic coordinate y.utm
aspect Exposure (degrees from north)
eleva Elevation (m)
slope Slope (degrees)
distr Distance to dirt roads
distcity Distance to cities
distriver Distance to paved roads
covera Land use classifications according to a polygon
coverb Land use classifications according to a polygon
tempe Minimum temperature of the coldest month
ppan Annual precipitation
ndii Normalized difference infrared index

forestHawaii *Contains information of forest plots across the Hawaiian archipelago.*

Description

Diameter at breast height (or occurrence) of individual trees, shrubs and tree ferns across 530 plots across the Hawaiian archipelago and includes native status and cultivated status of the 185 species.

Usage

```
data(forestHawaii)
```

Format

Contains 18 variables, as follows:

island Island name.

plot.id Unique numeric identifier for each plot.

study Brief name of study.

plot.area Plot area in m^2.

longitude Longitude of plot in decimal degrees; WGS84 coordinate system.

latitude Latitude of plot in decimal degrees; WGS84 coordinate system.

year Year in which plot data was collected.

census Numeric identifier for each census.

tree.id Unique numeric identifier for each individual.

scientific.name Genus and species of each individual following TPL v. 1.1.

family Family of each individual following TPL v. 1.1.

angiosperm Binary variable (1 = yes, 0 = no) indicating whether an individual is classified as an angiosperm following APG III.

monocot Binary variable (1 = yes, 0 = no) indicating whether an individual is classified as a monocot following APG III.

native.status Categorical variable ("native", "alien", "uncertain") indicating alien status of each individual following Wagner et al. (2005).

cultivated.status Binary variable (1 = yes, 0 = no, NA = not applicable) indicating if species is cultivated following PIER.

abundance Number of individuals (all = 1).

abundance.ha Abundance of each individual on a per hectare basis.

dbh Diameter at 1.3 m (in cm) for each individual; NA indicates that size was not measured, but was classified by size class.

Source

The data were obtained from the DRYAD repository at doi:10.5061/dryad.1kk02qr.

gmean *Function to compute the geometric mean of a vector*

Description

Computes the geometric mean of a numeric vector. It is the n-th root of the product of n numbers, as follows.

$$y_g = \left(\prod_{i=1}^{n} y_i \right)^{1/n}$$

for $y_i > 0$. It can also be understood as the average of the logarithmic values of a data set, converted back to a base 10 number. The geometric mean is a central position statistics of a random variable.

Usage

```
gmean(v)
```

Arguments

v	is a numeric vector

Details

Notice that can only be computed for positive values. For negative values, there are alternatives, but not covered here.

Value

This function returns the geometric mean, a numeric scalar.

Author(s)

Christian Salas-Eljatib.

Examples

```
y.var <- runif(10, min=10, max=45)
gmean(y.var)
```

hawaii *Diameter growth increments of a tropical tree species in Hawaii*

Description

Tree size, competition, and diameter growth increment of Metrosideros polymorpha trees collected in the Kilauea Volcano, Hawaii. Data containing 64 observations at the current annual growth rate (defined as dbh increment within one calendar year) of each tree was measured from 1986 to 1988 using band dendrometers.

Usage

```
data(hawaii)
```

Format

The dataframe has the following columns:

tree.code Tree number identification. The first letter of the ID represents a cohort. Six cohorts representing a chronosequence were sampled.

dbh Initial stem diameter, in cm.

toth Total height, in m.

crown.area Crown outline area, in square meters.

comp.ind Competition index (Basal area of nearest neighbor divided by square of distance to nearest neighbor plus basal area of second nearest neighbor divided by square of distance to second nearest neighbor).

cai.1986 Current annual stem diameter increment during 1986, in mm.

cai.1987 Current annual stem diameter increment during 1987, in mm.

cai.1988 Current annual stem diameter increment during 1988, in mm.

Source

The data were obtained from Gerrish and Mueller-Dombois (1999).

idahohd *Tree height-diameter data from Idaho (USA)*

Description

These data are forest inventory measures from the Upper Flat Creek stand of the University of Idaho Experimental Forest, dated 1991.

Usage

```
data(idahohd)
```

Format

Contains five variables, as follows:

plot Plot number.

tree Tree within plot.

species A factor with levels DF = Douglas-fir, GF = Grand fir, SF = Subalpine fir, WL = Western larch, WC = Western red cedar, WP = White pine.

dbh Diameter 137 cm perpendicular to the bole, cm.

toth Height of the tree, in m.

Source

The data were assembled from the 'ufc' dataframe from the 'alr4' library.

References

Weisberg S. 2014. Applied Linear Regression. 4th edition. New York: Wiley.

Examples

```
data(idahohd)
head(idahohd)

`invasivesRCI` *Contains regeneration microsite data in Robinson Crusoe Island forest*

Description

These are plot-level measurement (2x2 m) data from the forests in the Robinson Crusoe Island, located in the Pacific Ocean, 667 km from mainland Chile. Measurements were collected in transects of 100 to 240 meters in which, 398 squared plots (2x2 m) were set to include canopy gaps, gap borders and closed forest conditions.

Usage

```
data(invasivesRCI)
```

Format

Data has the following columns

plot.id Plot identification code

Gap.type Canopy gap classified as invaded=Inv, non invaded= Nat or treated =Treat(considering the estimated cover of invasive plant species)

Forest.zone Location of the plot (gap, border or forest)

Ferns Estimated cover of fern species (in 2x2 plots)

Moss.liverw Estimated cover of mosses and liverworts (in 2x2 plots)

Cwd Estimated cover of coarse woody debris > 3 cm diameter (in 2x2 plots)

Litter Estimated cover of litter (in 2x2 plots)

Ms Estimated cover of mineral soil (in 2x2 plots)

Rock Estimated cover of rocks (in 2x2 plots)

Est.age Age category for the canopy gap associated to each plot

Source

The data are provided courtesy of Prof. Rodrigo Vargas-Gaete at Universidad de La Frontera (Temuco, Chile).

References

Vargas-Gaete R, Salas-Eljatib C, Gärtner SM, Vidal OJ, Bannister JR, Pauchard A. 2018. Invasive plant species thresholds in the forests of Robinson Crusoe Island, Chile. Plant Ecology & Diversity, 11(2), 205-215.

kurto *Computes the sample kurtosis of a distribution*

Description

The kurtosis is about the tailedness, or the degree of heaviness of the tails, in the frequency distribution. The function computes an estimator of the kurtosis.

Usage

```
kurto(x, na.rm = TRUE)
```

Arguments

x	a numeric vector of a random variable.
na.rm	logical operator to remove NA values. The default is set to TRUE.

Details

The kurtosis of a random variable is the fourth moment of the standardized variable. There are several ways of parameterizing a kurtosis estimator, such as depending on the fourth moment and the standard deviation of the random variable.

Value

An estimator of the kurtosis.

Author(s)

Christian Salas-Eljatib

Examples

```
y.var<-rnorm(100);x.var<-rbeta(100,.2,2)
kurto(y.var)
kurto(x.var)
```

`landCoverSantiago` *Land-cover, environmental and sociodemographic data for the 34 municipalities composing the Greater Santiago area, Santiago, Chile.*

Description

dataset contains 476 observations, 34 categorical and 442 numerical. Land-cover data was generated through remote sensing classification techniques using Sentinel-2 satellite images from year 2016. Temperatures were obtained from TIRS band 10 of Landsat 8 satellites images. Particulate matter concentrations were estimated using spatial modelling techniques from 10 pollution stations distributed in the city. Altitude was generated from a Digital Elevation Model. Population and poverty were gathered from Casen 2017 survey.

Usage

```
data(landCoverSantiago)
```

Format

The data frame contains four variables as follows:

Comuna Name of Municipality

p.Construido Percentage of surface covered by built-up area

p.Vegetacion Percentage of surface covered by vegetation

p.Desnudo Percentage of surface covered by bare soil

p.Pasto Percentage of surface covered by deciduous vegetation

p.Deciduo Percentage of surface covered by evergreen vegetation

p.Siempreverde Percentage of surface covered by evergreen vegetation

Temp Invierno Land surface temperature in celsius degrees at 2pm on a winter 0% cloud day

Temp Verano Land surface temperature in celsius degrees at 2pm on a summer 0% cloud day

PM10 Invierno Average particulate matter 10 micron during winter months

PM10 Verano Average particulate matter 10 micron during summer months

p.pobreza 2017 Percentage of people under poverty line year 2017

Altitud promedio Average altitude of municipal area

Poblacion Total population of municipality

Source

Data were provided by Dr Ignacio Fernandez at Universidad Adolfo Ibanez (Santiago, Chile).

`landCoverSantiago2` *Cobertura territorial, ambiental y sociodemografica de los 34 municipios que componen el area del Gran Santiago, Santiago, Chile..*

Description

El conjunto de datos contiene 476 observaciones, 34 categoricas y 442 numericas. Los datos de cobertura terrestre se generaron mediante tecnicas de clasificacion de teledeteccion utilizando imagenes de satelite Sentinel-2 del año 2016. Las temperaturas se obtuvieron de la banda TIRS 10 de las imagenes de los satelites Landsat 8. Las concentraciones de material particulado se estimaron mediante tecnicas de modelado espacial de 10 estaciones de contaminacion distribuidas en la ciudad. La altitud se genero a partir de un modelo de elevacion digital. La poblacion y la pobreza se obtuvieron de la encuesta Casen 2017.

Usage

```
data(landCoverSantiago2)
```

Format

Variables se describen a continuacion:

Comuna Name of Municipality

p.Construido Porcentaje de superficie cubierta por area construida

p.Vegetacion Porcentaje de superficie cubierta por vegetacion

p.Desnudo Porcentaje de superficie cubierta por suelo desnudo

p.Pasto Porcentaje de superficie cubierta por cesped

p.Deciduo Porcentaje de superficie cubierta por vegetacion de hoja caduca

p.Siempreverde Porcentaje de superficie cubierta por vegetacion siempre verde

Temp Invierno Temperatura de la superficie terrestre en grados celsius a las 2 p.m.en un dia de invierno con 0% de nubes

Temp Verano Temperatura de la superficie de la tierra en grados celsius a las 2 p.m.en un dia de verano con 0% de nubes

PM10 Invierno Material particulado promedio de 10 micrones durante los meses de invierno

PM10 Verano Material particulado promedio de 10 micrones durante los meses de verano

p.pobreza 2017 Porcentaje de personas por debajo de la linea de pobreza año 2017

Altitud promedio Altitud media del termino municipal

Poblacion poblacion total del municipio

`lleuque` *Contains species composition data of Prumnopitys andina (Lleuque) forests*

Description

Contains species composition data for forests with presence of Lleuque (Prumnopitys andina)

Usage

```
lleuque
```

Format

The dataframe has the following columns

stand Stand number

plot.num Plot number

Aus.chi Tree density/ha of Austrocedrus chilensis

May.dis Tree density/ha of Maytenus disticha

Not.obl Tree density/ha of Nothofagus obliqua

Pru.and Tree density/ha of Prumnopitys andina

Source

`lrt` *Computes a likelihood ratio test between a reduced model and a full model*

Description

Computes a likelihood ratio test between a reduced model (modr) and a full model (modf). Both models must be previously fitted by maximum likelihood.

Usage

```
lrt(modr, modf)
```

Arguments

`modr`	is a previously fitted model having less parameters than modf
`modf`	is a previously fitted model having more parameters than modr

Details

Double-check the order of the reduced and full model, before of using the model

Value

This function returns an object having the following elements: "loglik.Modr" maximized log-likelihood of modr; "loglik.Modf" maximized log-likelihood of modf; "dif.loglik" difference in log-likelihood between both models, and "dif.df" difference in degrees of freedong of both models, and "p-value" is the p-value for the LRT.

```

moda *Computes the mode*

Description

Computes the mode of a random variable.

Usage

```
moda(y = y)
```

Arguments

y	is a numeric vector.

Details

The mode is an statistics representing the most "used" value of the random variable as a way of central position.

Value

The function returns the mode, a numeric scalar.

Author(s)

Christian Salas-Eljatib.

Examples

```
set.seed(1234)
variable <- rnorm(10, mean=45,sd=6)
#using the function
moda(y=variable)
moda(variable)
```

pinaster *Tree volume for Pinus pinaster in the Baixo-Mino, Galicia, Spain.*

Description

These are volume measurements data of sample trees in the Baixo-Mino region in Galicia, Spain.

Usage

```
data(pinaster)
```

Format

Contains tree-level variables, as follows:

stand stand number from the sample tree was selected.

si Site index of the stand.

tree.no tree number.

dbh Diameter at breast height, in cm.

toth Total height, in m.

d4 Upper-stem diameter at 4 m, in cm.

volwb Tree gross volume, in m^3 with bark.

volwob Tree gross volume, in m^3 without bark.

Source

pinusContorta *Contains spatial location of Pinus contorta trees in sample plots.*

Description

These are tree-level measurement data, with cartesian location of each tree, from Pinus contorta invasion in Patagonian steppe in Coyhaique in southhern Chile, measured in 2011. There are 3 plots, each of 10.000 m^2.

Usage

```
data(pinusContorta)
```

Format

Contains eight variables, as follows:

plot.id Plot sample ID.

tree.id Tree identificator number in each plot. Same indv/id for multi-stem trees.

y.coord coordinate of S latitude.

x.coord coordinate of W longitude.

substrate Ground cover in which each pine grow. Bare soil, Festuca pallescens, Baccharis magellanica, Oreopulus glacialis, Acaena integerrima and others species.

drc Diameter at the root collar on trees, in mm.

h Height of trees, in cm.

canopy.area Proyection of canopy area of each tree, in square meters.

Source

pinusSpp — *Tree-level variables of several sample plots of invasive Pinus spp in Chile.*

Description

These are tree-lavel measurement data from Pinus spp invasion in Araucaria-Nothofagus forests in the Malalcahuello National Reserve in La Araucania region in southhern Chile, measured in 2012. There are 26 plots and plot size is 100 m^2.

Usage

```
data(pinusSpp)
```

Format

Contains eight variables, as follows:

plot.id Plot sample ID.

plot.size Plot size, en m^2.

lat.s Decimal coordinate of S latitude.

long.w Decimal coordinate of W longitude.

indv.id Tree identificator number in each plot. Same indv/id for multi-stem trees.

stem.id Stem identificator number in each plot.

spp Specie.

dbh Diameter at breast-height, in cm.

toth Total height, in m.

hcb Height to crown base, in m.

crown.lenght Crown lenght, in m.

`plantsHawaii` *Maximum plant size in the Hawaiian archipelago.*

Description

Maximum plant size of 58 tree, shrub and tree fern species that occur in 530 forest plots across the Hawaiian archipelago.

Usage

```
data(plantsHawaii)
```

Format

Contains six variables, as follows:

scientific.name Genus and epithet of each individual following The Plant List v. 1.1 (2013).

family Family of each individual following The Plant List v. 1.1 (2013).

native.status Categorical variable ('native', 'alien', 'uncertain') indicating alien status of each individual following Wagner et al. (2005).

n Number of individuals used to estimate maximum plant size.

d.95 Maximum plant size, estimated as D950.1 (King et al. 2006).

d.max.3 Maximum plant size, estimated as Dmax3 (King et al. 2006).

ptaeda *Height growth of Pinus taeda (Loblolly pine) trees*

Description

The Loblolly data frame has 84 rows and tree columns of records of the tree height growth of Loblolly pine trees. This dataframe is a slight modification to the original dataframe "Loblolly" from the datasets R package.

Usage

```
data(ptaeda)
```

Format

An object of class c("nfnGroupedData", "nfGroupedData", "groupedData", "data.frame") containing the following columns:

seed.id an ordered factor indicating the seed source for the tree. The ordering is according to increasing maximum height.

age a numeric vector of tree ages, in yr.

toth a numeric vector of tree heights, in m.

Source

Pinheiro, J. C. and Bates, D. M. (2000) Mixed-effects Models in S and S-PLUS. Springer.

Examples

```
data(ptaeda)
plot(toth ~ age, data = ptaeda, subset = seed.id == 329,
     xlab = "Age (yr)", las = 1,
     ylab = "Height (m)")
```

ptaeda2 *Crecimiento en altura de Pinus taeda*

Description

Esta dataframe contiene 84 folas y tres columnas de crecimiento en altura de árboles de Pinus taeda (Loblolly pine). Es una modificación de la dataframe "Loblolly" del paquete 'datasets' de R.

Usage

```
data(ptaeda2)
```

Format

An object of class c("nfnGroupedData", "nfGroupedData", "groupedData", "data.frame") containing the following columns:

semilla.id Un factor indicando el origen de la semilla del árbol.

edad Edad del árbol, en años.

atot Altura total, en m.

Source

Pinheiro, J. C. and Bates, D. M. (2000) Mixed-effects Models in S and S-PLUS. Springer.

Examples

```
data(ptaeda2)
plot(atot ~ edad, data = ptaeda2, subset = semilla.id == 329,
     xlab = "Edad (años)", las = 1,

```

---

pvalt *Obtain the P-value for a Standard t-distributed random variable*

Description

Function to compute the P-value for a Standard t-distributed random variable.

Usage

```
pvalt(t.value, df, decnum = 5)
```

Arguments

t.value	A numeric random variable following a t-student pdf distribution.
df	degrees of freedom of the random variable following a t-student pdf distribution.
decnum	the number of decimals to be used in the output. The default is set to 5.

Details

It is suited to compute the P-value for any random variable following a Standard t probability density function. For instance, to obtain the p-value in a t-test.

Value

The function returns the P-value or probability of getting a value as large as t.value.

Author(s)

Christian Salas-Eljatib

Examples

```
## Load dataset
df <- datana::araucaria
#
## Computes the t-test statistics (from the 'stats' package)
t.value <- stats::t.test(df$hdom)
t.v <- as.numeric(t.value$statistic)
deg.f <- as.numeric(t.value$parameter)

## Obtaining the p value
pvalt(t.v,deg.f)
```

---

pvalz *Obtain the P-value for a Standard Gaussian random variable*

Description

Function to computes the P-value for a Standard Gaussian random variable.

Usage

```
pvalz(zval, decnum = 5)
```

Arguments

zval	A numeric random variable following a Standard Gaussian distribution.
decnum	the number of decimals to be used in the output. The default is set to 5.

Details

It is suited to compute the P-value for any random variable following a Standard Gaussian probability density function.

Value

This function returns the P-value or probability of getting a value as large as 'zval'.

Author(s)

Christian Salas-Eljatib

Examples

```
pvalz(1.96)
```

`radiatapl` *Sampling plots data from a Pinus radiata plantation near Capitan Pastene, Region de La Araucania, Chile.*

Description

Tree-level information collected within sample plots in a forestry plantation of Pinus radiata near Capitan Pastene, Southern Chile. Sample plots size is 150 150 m^2.

Usage

```
data(radiatapl)
```

Format

The data frame contains four variables as follows:

plot Plot number identification.

tree Tree number identification.

dbh Diameter at breast height, in cm.

heigth Total height, in m.

Source

The data are provided courtesy of Mr. Mauricio Lobos-Beneventi (Temuco, Chile).

Examples

```
data(radiatapl)
head(radiatapl)
```

`radiatapl2` *Datos a nivel de árbol de parcelas de muestreo en plantaciones de Pinus radiata*

Description

Es un listado de árboles con características medidas dentro de unidades de muestreo en una plantacion de Pinus radiata cercana a Capitan Pastene, Region de la Araucania, Chile. Las parcelas de muestreo tienen 150 m^2.

Usage

```
data(radiatapl2)
```

Format

Los datos contienen las siguientes columnas

parce Número de identificación de la parcela de muestreo.

arbol Número de identificación del árbol dentro de la parcela.

dap Diámetro a los 1.3 m en el fuste, en cm.

atot Altura total, en m. Solo registrada para algunos árboles muestra.

Source

Los datos son cortesia del Ing. Forestal Mauricio Lobos-Beneventi (Temuco, Chile).

raulihg *Height growth of Nothofagus alpina trees in Chile.*

Description

Time series data of height for rauli (Nothofagus alpina) trees in south-central Chile. These sampled trees are part of the ones used in Salas-Eljatib (2021, Ecological Applications). The full citation is provided below.

Usage

```
data(raulihg)
```

Format

The data frame contains four variables as follows:

tree.code tree id code

spp species common name

bha.t breast-height age, in yrs.

h.t total height, in m.

Source

Data were provided by Dr Christian Salas-Eljatib (Santiago, Chile).

References

```

`raulihg2` *Crecimiento en altura de árboles de Nothofagus alpina.*

Description

Datos de series de tiempo de altura para árboles muestreados de Nothofagus alpina (rauli) en el centro-sur de Chile. Estos árboles son parte de los usados en Salas-Eljatib (2021, Ecological Applications). La cita completa se da en referencias.

Usage

```
data(raulihg2)
```

Format

Contiene variables de nivel individual, como se describen a continuacion::

tree.code Codigo del árbol

spp Nombre comun especie

bha.t Edad a la altura del pecho, en años.

h.t Altura total, en m.

Source

regNothofagus *Contains information about regeneration of Nothofagus seedlings.*

Description

Dataset contains 442 observations.

Usage

```
data(regNothofagus)
```

Format

Contains 15 variables, as follows:

site Id site of study.

plot Number of plot.

scar Scarification in percentage of total area.

x.trans.total Transmitted radiation in percentage.

kPa Soil resistance to penetration.

SWC Soil water content.

SM Exposed mineral soil.

litter Litter cover in percentage.

CWD Ocular estimation in the regeneration plot in percentage.

MT Microtopography. 1 plane, 2 convex, 3 concave, 4 mixed (convex and concave) in the regeneration plot.

S Ground-layer vascular species richness in the regeneration plot..

LLES Long-lived early-seral tree species (N. dombeyi , N. alpina , Nothofagus pumilio).

SLES Short-lived early-seral plants (Ribes spp. and Fuchsia sp).

LLLS Long-lived late-seral tree species (L. philippiana and Dasyphyllum diacantaoides).

log.bam Logarithm of the cover of bamboo (%) in the regeneration plot.

Source

The data were obtained from the DRYAD repository at doi:10.5061/dryad.3q977

simula *Simulated yield of forestry plantations of exotic species in Chile.*

Description

The yield tables of simulated plantations of Pinus radiata, Eucalyptus globulus, and Eucalyptus nitens are obtained from the Radiata simulator and EucaSim simulator built in Chile. Several stand-level variables are part of the output.

Usage

```
data(simula)
```

Format

Contains stand-level variables, as follows:

species "P. radiata" is Pinus radiata, "E. globulus" is Eucalyptus globulus, and "E. nitens" is Eucalyptus nitens.

age plantation age, in years

tph Tree density, in trees/ha

gha Basal area, in m^2/ha

toph Dominant height, in m

qmd quadratic mean diameter, in cm

totvol gross stand volume, in m^3/ha

viu.10 stand volume below an utilizacion index of 10 cm, in m^3/ha

viu.15 stand volume below an utilizacion index of 15 cm, in m^3/ha

viu.20 stand volume below an utilizacion index of 20 cm, in m^3/ha

viu.25 stand volume below an utilizacion index of 25 cm, in m^3/ha

Source

The data were obtained as outputs for plantations without management in Chile. The academic version of the simulator was used. You can visit mnssimulacion.cl

Examples

```
data(simula)
```

skew *Computes the skewness of a numeric vector*

Description

The skewness is about the departure from symmetry of a frequency distribution. Therefore, It is about asymmetry. One way to assess asymmetry of a random variable is to compute an statistics representing its skewness. The current function an dimensionless statistics of the skewness of given vector.

Usage

```
skew(x, na.rm = TRUE)
```

Arguments

x	A numeric vector representing a random variable.
na.rm	Logical value to remove NA values. The default is set to TRUE.

Details

The skewness of a random variable is the third moment of the standardized variable. There are several ways of parameterizing an skewness estimator, such as depending on the third moment and the standard deviation of the random variable.

Value

The value of the the skewness of given vector

Author(s)

Christian Salas-Eljatib.

Examples

```
y.var<-rnorm(100);x.var<-rbeta(100,.2,2)
skew(y.var)
skew(x.var)
```

`slashpine` *Biomass dataset*

Description

Dataset that contains nine pairs of columns with information about biomass of 40 samples.

Usage

```
data(slashpine)
```

Format

The data frame contains nine variables as follows:

tree_id tree code

dbh diameter

h heigth

lcl live crown lenght

age age tree

wood wood biomass

bark bark biomass

crown crown biomass

tree tree biomass

Source

Data were provided by Dr Christian Salas-Eljatib (Universidad de Chile, Santiago, Chile).

snaspeChile *On the National System of State Protected Wild Areas (SNASPE) of Chile.*

Description

Dataset contains the protected wild areas of Chile that are part of the National System of State Protected Wild Areas (SNASPE).

Usage

```
data(snaspeChile)
```

Format

Contains the following variables:

unit.id Number for the unit.

unit Name of the protected area.

category Category of the unit. It can be either a National Park, a National Reserve or a Natural Monument.

commune Name of the commune (the smallest Chilean territorial division) where the unit is located.

province Province where the comunne is located (one territorial division level above the commune).

region Region where the province is located (one territorial division level above the province and the biggest Chilean territorial division).

perim.km Perimeter, in km.

area.ha Area, in hectares.

area.m2 Area, in m^2.

Source

These data is freely available at https://ide.minagri.gob.cl/geoweb/2019/11/21/medio-ambiente/

soiltreat *Soil treatment experiment in tree seedlings*

Description

A test was made of the effect of three soil treatments on the height growth of 2-year-old seedlings. Treatments were assigned at random to the three plots within each of 11 blocks. Each plot was made up of 50 seedlings. Average 5-year height growth was the criterion for evaluating treatments.

Usage

```
data(soiltreat)
```

Format

Contains the four following columns, at the plot-level,

block Block unit.

treat Treatment level.

ini.h Initial height, in m.

inc.h Increment in height during 5-year, in m.

Source

Table in page 71 of Freese (1967). The data were entered by Nayeli Ramirez, a former student of Prof. Christian Salas-Eljatib.

soiltreat2 *Tratamientos del suelo en el crecimiento de plantulas.*

Description

Un experimento sobre el efecto de tres tratamientos del suelo en el crecimiento en altura de plantulas de 2-años de edad. Los tratamientos fueron asignados aleatoriamente a tres parcelas dentro de cada uno de 11 bloques. Cada parcela esta constituida por hasta 50 plantulas. El promedio del incremento en altura de los ultimos 5 años fue la variable de interes para evaluar los tratamientos.

Usage

```
data(soiltreat2)
```

Format

Los datos, a nivel de parcela, tienen las siguientes columnas,

bloque Bloque del experimento.

tmo Factor tratamiento, medido en tres nivels.

alt.ini Altura initial, rn m.

alt.inc Incremento en altura durante los últimos cinco años, en m.

spatAustria *Tree locations for several plots of Norway spruce in Austria*

Description

The Cartesian position, species, year, ID tree , and diameter of trees within a plot were measured.

Usage

```
data(spatAustria)
```

Format

Contains cartesian position of trees, and covariates, in sample plots, as follows:

plot.code Plot identificator

tree.code Tree identificator

spp.name species abreviation as follows: PCAB=Picea abies, FASY= Fagus sylvatica, QCPE=Quercus petraea , PNSY= Pinus Sylvestris, LADC=Larix decidua

x.coord Cartesian position in the X-axis, in m

y.coord Cartesian position in the Y-axis, in m

year Measurement year

dbh diameter at breast-height, in cm

speciesList *Names and other information of plant species (mainly trees)*

Description

This data set provides names (taxonomy), of plant species. Includes codes and name abbreviations used by the Biometrics group at the Forest Biometrics and Modelling Lab, Universidad de Chile, Santiago, Chile.

Usage

```
data(speciesList)
```

Format

A data frame with 63 observations on 31 variables

nesp Unique correlative specie number

spp.ci.name Species scientific name

spp.ci.abb Species scientific name abbreviation

common.name Species common name. No blank spaces, no special characters

common.nameBlank Species common name. With blank spaces, no special characters

esp Species code: code given by CEM Biometrics to identify species for different processing routines

common.nameLatex Species common name formatted for Latex

nTaxon Unique number of the taxon (i.e., species)

kingdom Taxonomic rank Kingdom. In this datase, all species belong to the Kingdom Plantae

division Taxonomic rank division or phylum within the Kingdom

class Taxonomic rank Class within the Kingdom

order Taxonomic rank Order within the Class

family Taxonomic rank Family within the Order

spp.ci.full Full scientific name including author

genus Taxonomic rank Genus within the Family

epithet Specific epithet

sppAuthor Species author

subSpp Subespecies: one of two or more populations of a species varying from one another by morphological characteristics

subSppAuthor Subespecies author

varSpp Species variety or varietas

varSppAuthor Variety author

formSpp Form or forma

formSppAuthor Form author

commonNamesList List of common names per species, separated by commas

synonyms Synonyms of the scientific name by which the species has been or is known

borCountries Border countries given the species distribution range

habit Habit. The general appearance, growth form, or architecture e.g., tree, shrub, grass

lifeCycle Life cycle

statusOri Status according to the species origin: Native or Endemic

regDist Distribution range of the species, within Chile administrative regions

elevRange Distribution range of the species, in terms of elevation. Meters above sea level

sppAbundance *Contains information of abundance of plant species in the central-southern Andes of Chile.*

Description

Abundance of plant species [50 total] (at parcel scale [100 m^2]) in burned Araucaria-Nothofagus forests with different levels of fire severity (ie, unburned = unburned, low_sev = low severity, mid_sev = medium severity , high_sev = high severity) in the China Muerta National Reserve, Andes of central-southern Chile.

Usage

```
data(sppAbundance)
```

Format

Contains 6 variables, as follows:

sp.name name of specie.

sp.code.name code of specie

unburned Abundance of plants unburned.

low.sev Abundance of plants for low severity of burned.

mid.sev Abundance of plants for middle severity of burned.

high.sev Abundance of plants for high severity of burned.

Source

sppTraits *Contains information of functional traits of species.*

Description

Dataset contains 48 observations about about functional trait values for each of the 48 study species, including 23 evergreen and 25 deciduous.

Usage

```
data(sppTraits)
```

Format

Contains 17 variables, as follows:

sp Abbreviated name of specie.

sp.name Name of specie.

family Family of specie.

genus Genus of specie.

phyl Type of phylogeny.

l.hab Type of leaf habit.

leaf Type of leaf.

lt .

lma Leaf mass area.

amass Photosynthetic capacity per unit leaf mass.

n.mass Leaf N content per unit mass.

pmass Leaf P content per unit mass.

l.lifespan Leaf life span.

standLleuque *Plot-level data with variables from Andean Prumnopitys forests*

Description

Data on density, basal area, mean square diameter and other variables of 24 plots for Lleuque is provided.

Usage

```
data(standLleuque)
```

Format

The data frame contains seven variables as follows:

rodal number of stand

plot.id code of plot

nha Density of plot

gha Basal area of plot

qmd Quadratic mean diameter of plot

toph Dominant height of plot

structure Forest structure level: open, secondary adult, pure

data(standLleuque2)
head(standLleuque2)
```

`timeserplot` *Produces a time series plot*

Description

Produces a time series plot, of variable 'y' as a function of 'x' by an observational unit factor.

Usage

```
timeserplot(
  data = data,
  y = y,
  x = x,
  obs.unit = obs.unit,
  factor1 = NA,
  factor2 = NA,
  only.lines = FALSE,
  ylab = NA,
  xlab = NA,
  linetype.lab = NA,
  factor2.line = TRUE,
  factor2.col = FALSE,
  max.y.all = NA,
  levels.i.want = FALSE,
  col.lev.i.want = FALSE,
  col.lines = FALSE
)
```

Arguments

`data`	a dataframe with at least tree columns representing the response variable ("y"), the main predictor variable ("x"), and a variable indicating the observational unit ("obs.unit").
`y`	a character giving the column name of the response variable or variable of interest.
`x`	a character giving the column name of the main predictor variable. Generally this variable is time.
`obs.unit`	a character giving the column name containing the info of the observational unit.
`factor1`	an optional character having the name of a column having a factor variable (e.g., treatment). The detault value is set to NULL.
`factor2`	an optional character having the name of a column having another factor variable (e.g., species). The detault value is set to NULL.
`only.lines`	a logic value if only lines, but not including dots, are going to be drwan in the plot. The detault value is set to FALSE.
`ylab`	Label for the Y-axis

xlab	Label for the X-axis
linetype.lab	is an optional string to be used as the title of the factor being represented by lines. It is only needed if factor1 and factor2 are defined. See example.
factor2.line	a logic value if the second factor, factor2, is going to be segregated according to the type of lines. The detault value is set to TRUE.
factor2.col	a logic value if the second factor, factor2, is going to be segregated according to the color of the lines only. The detault value is set to FALSE.
max.y.all	A number representing the maximum level of Y-axis for all classes
levels.i.want	A vector having the levels for the factor under study
col.lev.i.want	A vector having the colors to be used for the factor under study
col.lines	A string specifying the single color to be used for the lines of the timeseries

Details

Both 'y' and 'x' must be numeric variables, and the column representing the observational unit, must be a factor. This factor identifies the longitudinal context of the data, for instance, a student being measured on time. Besides, two more factors can be added to the plotting details, in order to represent the potential variability among them.

Value

This function returns a time series plot

Note

Please, uses with caution, and run first the examples to understand it better.

```

`trailCameraTrap` *Contains information of Camera trap data on medium to large terrestrial mammals collected at 54 camera stations in Ruaha National Park, southern Tanzania.*

Description

Dataset contains 14604 observations and sampling was carried out for two months during the dry season of 2013 and two months during the wet season of 2014. Each camera station is associated with a randomly placed camera and a trail-based camer, with the aim of comparing communities resulting from the two camera trap placement strategies.

Usage

```
data(trailCameraTrap)
```

Format

Contains 6 variables, as follows:

reference Number of observation od datasets.

placement Type of "placement" placed in each station (random or trail).

season Season where were made the samplings.

station Station where were collected the data.

specie Name of specie medium to large terrestrial mammals.

date.time The date and time of each photographic event is also given.

treegr *Diameter and height growth of Grand-fir (Abies grandis) sample trees*

Description

Diameter and height growth of 66 Grand-fir trees. Data derived from stem analysis sample trees collected by Dr Albert Stage (US Forest Service, Moscow, ID, USA.)

Usage

```
data(treegr)
```

Format

Contains seven column, as follows:

tree.id Tree number identificator. An unique number to each sample tree.

forest Forest type.

habitat Forest habitat type.

tree.code A composite tree code representing the following columns: tree.id-forest-habitat

age Age, in yr

dbh Diameter at breast-height, in cm.

toth Total height, in m.

Source

Originally, the data were provided by Dr Albert Stage (R.I.P) to Professor Andrew Robinson (University of Idaho, USA), whom used them to explain the fitting of statistical models. Dr Christian Salas-Eljatib was a former graduate student of Statistics of Prof Robinson at the Univ. of Idaho.

`treegr2` *Crecimiento en diámetro y altura de árboles muestras de Grand-fir (Abies grandis)*

Description

Crecimiento en diámetro y altura de 66 árboles de Grand-fir. Los datos fueron derivados a partir de árboles muestras de analisis fustal colectados por el Dr Albert Stage (US Forest Service, Moscow, ID, USA.)

Usage

```
data(treegr2)
```

Format

Contiene las siguientes siete columnas:

num.arb Número identificador del árbol. Unico para cada árbol muestra.

bosque Tipo forestal.

habitat Clasificación de tipo de habitat.

cod.arb Un código que combina a las siguientes columnas: num.arb-bosque-habitat

edad Edad, en años.

dap Diámetro a la altura del pecho, en cm. Note que los decimales es debido a que esta variable originalmente fue medida en pulgadas.

atot Altura total, in m. Note que los decimales es debido a que esta variable fue originalmente medida en pies.

Source

Originalmente los datos fueron cedidos por el Dr Albert Stage (Q.E.P.D) al Profesor Andrew Robinson (University of Idaho, USA), quien los usaba para explicar el ajuste de modelos estadísticos. El Dr Christian Salas-Eljatib fue un estudiante de postgrado en estadística del Prof. Robinson en la Univ. of Idaho.

`treelistinve` *Tree-list data in a forest inventory.*

Description

Tree-level variables measured within three sample plots in a forest inventory. Notice that plots might have different areas.

Usage

```
data(treelistinve)
```

Format

Contains tree-level variables, as follows:

plot Plot number.

plot.size Plot size, in m^2.

tree Tree identificator

species species common name as follows: Olivillo= Aextocicon puncatatum, Tepa= Laureliopsis philippiana, Lingue= Persea lingues, Coigue=Nothofagus dombeyi, Roble=Nothofagus obliqua, Other=Other

dbh Diameter at breast-height, in cm

toth Total height, in m. Only measured for some sample trees.

Source

treevol *Diameter, height and volume for Black Cherry Trees*

Description

This data set provides measurements of the diameter, height and volume of timber in 31 felled black cherry trees. The records are a slight modification to the original dataframe "trees" from the datasets R package.

Usage

```
data(treevol)
```

Format

A data frame with 31 observations and three variables

dbh Diameter at breast height, in cm.

toth Total height, in m.

vtot Timber volume, in cubic meters.

Source

Ryan TA, Joiner BL, and Ryan BF. 1976. The Minitab Student Handbook. Duxbury Press.

Examples

```
pairs(treevol, panel = panel.smooth, main = "treevol dataframe")
plot(vtot ~ dbh, data = treevol, log = "xy")
coplot(log(vtot) ~ log(dbh) | toth, data = treevol,
       panel = panel.smooth)
summary(m1 <- lm(log(vtot) ~ log(dbh), data = treevol))
summary(m2 <- update(m1, ~ . + log(toth), data = treevol))
anova(m1,m2)
```

treevol2 *Volumen, altura, y diámetro para árboles de Black Cherry*

Description

Estos datos provienen de mediciones de volumen, altura y diámetro en 31 árboles volteados de black cherry (Prunus serotina). Son una modificacion la dataframe 'trees' del paquete datasets de R.

Usage

```
data(treevol2)
```

Format

Datos con 31 observaciones y tres variables

dap diámetro a la altura del pecho, en cm

atot altural total, en m

vtot volumen total, en m^3

Source

Ryan, T. A., Joiner, B. L. and Ryan, B. F. (1976) The Minitab Student Handbook. Duxbury Press.

Examples

```
pairs(treevol2, panel = panel.smooth, main = "treevol dataframe")
plot(vtot ~ dap, data = treevol2, log = "xy")
coplot(log(vtot) ~ log(dap) | atot, data = treevol2,
       panel = panel.smooth)
summary(m1 <- lm(log(vtot) ~ log(dap), data = treevol2))
summary(m2 <- update(m1, ~ . + log(atot), data = treevol2))
anova(m1,m2)
```

treevolroble *Tree volume of roble (Nothofagus obliqua) in the Rucamanque forest*

Description

These are tree-level measurement data of sample trees in the Rucamanque experimental forest, near Temuco, in the Araucania region in south-centralChile, measured in 1999. The data are the same as in the dataframe "treevolruca", but only having observations for the species roble (Nothofagus obliqua).

Usage

```
data(treevolroble)
```

Format

Contains tree-level variables, as follows:

tree.no Tree id

dbh Diameter at breast height, in cm

toth Total height, in m.

d6 Upper-stem diameter at 6 m, in cm

totv Tree gross volume, in m^3 with bark.

Source

The data are provided courtesy of Dr Christian Salas at the Universidad de Chile (Santiago, Chile).

treevolruca *Tree volume by species in the Rucamanque forest*

Description

These are tree-level measurement data of sample trees in the Rucamanque experimental forest, near Temuco, in the Araucania region in south-centralChile, measured in 1999. The following species are part of the data: laurel (laurelia sempervirens), lingue (Persea lingue), olivillo (Aextocicon puncatum), roble (Nothofagus obliqua), tepa (Laureliosis philippiana), y tineo (Weinmannia trichosperma).

Usage

```
data(treevolruca)
```

Format

Contains tree-level variables, as follows:

tree.no Tree id.

spp Species.

dbh Diameter at breast height, in cm.

toth Total height, in m.

d6 Upper-stem diameter at 6 m, in cm.

totv Tree gross volume, in m^3 with bark.

Source

xyboxplot *Creates a scatterplot with superposing boxplots*

Description

The function creates a scatterplot with superposing boxplots for the Y-axis variable. To a simple scatterplot between the response variable 'y' and the predictor variable 'x', this function superposes boxplots of the response by groups of the predictor variable. The main aim of the above described graph is to get a sense of the distribution of the response variable depending upon the predictor variable.

Usage

```
xyboxplot(x = x, y = y, col.dots = "blue", xlab = NULL, ylab = NULL)
```

Arguments

x	A numeric vector representing the time variable (X-axis).
y	A numeric vector representing the response variable (Y-axis).
col.dots	(optional) A string specifying the dot colors. Default is "blue".
xlab	(optional) A string specifying X-axis label.
ylab	(optional) A string specifying Y-axis label.

Details

Notice that the superposing boxplots for the Y-axis variable are computed by grouping the X-axis variable in 10 classes. Those classes are set by computing the ten percentiles of the X-axis variable, therefore each group has the same number of observations.

Value

The function returns the above described graph.

Examples

```
data(fishgrowth)
df <- fishgrowth
xyboxplot(x=df$age,y=df$length)
xyboxplot(x=df$age,y=df$length)
```

---

xyhist *A scatterplot with marginal histograms*

Description

The function produces a scatterplot between the 'y'-axis variable and the 'x'-axis variable, but also adding the marginal histograms for both variables.

Usage

```
xyhist(
  x = x,
  y = y,
  col.x = "blue",
  col.y = "red",
  xlab = NULL,
  ylab = NULL,
  x.lim = NULL,
  y.lim = NULL
)
```

Arguments

x	A numeric vector representing the X-axis variable
y	A numeric vector representing the Y-axis variable
col.x	(optional) A string specifying the color of the histogram of the X-variable. Default is "blue".
col.y	(optional) A string specifying the color of the histogram of the Y-variable. Default is "red".
xlab	(optional) A string specifying X-axis label. Default is "xvar".
ylab	(optional) A string specifying Y-axis label. Default is "yvar".
x.lim	(optional) A vector of two elements with the limits of the Y-axis. Default is the range of the X-variable.
y.lim	(optional) A vector of two elements with the limits of the Y-axis. Default is the range of the Y-variable.

Details

Both the response variable (Y-axis) and the predictor variable (X-axis) must be numeric.

Value

The function returns the above described graph.

Author(s)

Christian Salas-Eljatib

References

```
data(treevolroble)
df <- treevolroble
head(df)
xyhist(x=df$dbh,y=df$toth)
xyhist(x=df$dbh,y=df$toth, xlab="Variable X",  ylab="Variable Y")
xyhist(x=df$dbh,y=df$toth, xlab="Variable X", ylab="Variable Y",
  col.x = "gray",col.y="white")
```

xymultiplot *Figure of a matrix of scatterplots and histograms for several variables.*

Description

The function produces a panel of multiple scatterplots and histograms, showing the correlation coefficient among all pairs of variables. Notice that the data must contain only numeric variables.

Usage

```
xymultiplot(
  x,
  smooth = TRUE,
  scale = FALSE,
  density = TRUE,
  digits = 2,
  method = "pearson",
  pch = 20,
  lm = FALSE,
  cor = TRUE,
  jiggle = FALSE,
  factor = 2,
  col.hist = "cyan",
  col.densi.curve = "black",
  show.points = TRUE,
  col.points = "gray",
  smoother = FALSE,
  col.smooth = "red",
  ellipses = FALSE,
  col.ellip = "blue",
  col.cent.point = "green",
  rug = TRUE,
  breaks = "Sturges",
  cex.cor = 1,
  ci = FALSE,
  alpha = 0.05,
  ...
)
```

Arguments

x	is a dataframe containing all the numeric variables to be used for drawing the panel plot
smooth	a logical value for drawing smooth curves. The default is set to TRUE.
scale	scales the correlation font by the size of the absolute correlation. The default is set to FALSE.

density	a logical value for drawing a density curve. The default is set to TRUE.
digits	an optional numeric value for the digits to be used for drawing the correlation coefficient in the panel. Defaults is set to 2.
method	a string giving the method to be used for computing the correlation coefficient. Default is set to "pearson".
pch	The plot character (The default is 20, which looks like '.').
lm	Plot the linear fit rather than the LOESS smoothed fits. The default is FALSE.
cor	If plotting regressions, should correlations be reported? The default is TRUE.
jiggle	Should the points be jittered before plotting? The default is FALSE.
factor	factor for jittering (1-5), therefore only needed if "jiggle" is set to TRUE.
col.hist	a string giving the color to be used for the histograms of the panel. Default is set to "cyan".
col.densi.curve	a string with the name of the color to be used for the density curve. The default is set to "black".
show.points	a logical value for drawing the points in the scatter-plots. Defauls is set to TRUE.
col.points	a string giving the color to be used for the data points. Default is set to "gray".
smoother	If TRUE, then smooth.scatter the data points – slow but pretty with lots of subjects
col.smooth	a string giving the color to be used for the smoothed curve of the scatterplot. Default is set to "red".
ellipses	an optional logical value for drawing an ellipse for the scatter-plots. The default is set to FALSE.
col.ellip	a string giving the color to be used for the ellipse of the scatterplot. The default is set to "blue".
col.cent.point	a string giving the color to be used for the centroid point of the ellipse of the scatterplot. The default is set to "blue".
rug	a logical value for drawing the rugs in the histograms. Defauls is set to TRUE.
breaks	a string giving the method to be used for obtaining the breaks of the histogram. Defauls is set to "Sturges".
cex.cor	If this is specified, this will change the size of the text in the correlations. this allows one to also change the size of the points in the plot by specifying the normal cex values. If just specifying cex, it will change the character size, if cex.cor is specified, then cex will function to change the point size.
ci	Draw confidence intervals for the linear model or for the loess fit, defaults to ci=FALSE. If confidence intervals are not drawn, the fitting function is lowess.
alpha	an optional numeric value for the significance level. Defauls is set to 0.05.
...	other graphical parameters (see par and section 'Details' below).

Details

Generates a multipanel (matrix) of scatterplots and histograms to explore potential relationships among variables.

Value

This function returns a multipanel of scatterplots and histograms

Author(s)

A modification of Christian Salas-Eljatib of the function pairs.panels of the package "psych".
