

Package ‘AHPGaussian’

January 20, 2025

Type Package

Title New Multicriteria Method: AHPGaussian

Version 0.1.1

Date 2023-06-06

Maintainer Cid Edson Povoas <cidedson@gmail.com>

Depends R (>= 3.6.0), stats

Imports reshape2, methods

Description Implements the Analytic Hierarchy Process (AHP) method using Gaussian normalization (AHPGaussian) to derive the relative weights of the criteria and alternatives. It also includes functions for visualizing the results and generating graphical outputs. Method as described in: dos Santos, Marcos (2021) <[doi:10.13033/ijahp.v13i1.833](https://doi.org/10.13033/ijahp.v13i1.833)>.

Description

Analytic Hierarchy Process (AHP) is a method allowing individuals or groups to make complex decisions. The core concept of AHP is that alternatives are always compared pairwise (and not, say, by giving a score, or sorting alternatives). AHP is used in many fields, from finance to criminal investigation.

The AHP Gaussian is a modification of the AHP that uses a Gaussian function to model the pairwise comparisons between criteria and alternatives. In the traditional AHP, pairwise comparisons are made using numerical values on a scale from 1 to 9, which can be subjective and lead to inconsistencies. The AHP Gaussian addresses this issue by using a continuous function that allows for more precise and consistent comparisons.

The function is defined by a mean value and a standard deviation, which can be estimated from the pairwise comparison data. The resulting weights for the criteria and alternatives are obtained by solving a system of linear equations. The Gaussian AHP has been shown to be effective in various applications, including military decision-making and environmental management.

Usage

```
ahpgaussian(x)
```

Arguments

x A data.frame object.

Value

Values are returned from the analysis with results and graphical output

Author(s)

Examples

```
##  
## Example 1  
##  
  
ahpgaussian(warships)
```

summary.ahpgaussian *Summary Method for ahpgaussian objects*

Description

Returns (and prints) a summary list for ahpgaussian) objects.

Usage

```
## S3 method for class 'ahpgaussian'  
summary(object,  
        presentation=FALSE, ...)
```

Arguments

| | |
|--------------|--|
| object | A given object of the class ahpgaussian |
| presentation | Logic. If TRUE the summary of the class ahpgaussian is showed well formatted in the screen, else, return a list. The default is FALSE. |
| ... | Potential further arguments (require by generic). |

## ahpgaussian
##
# ahpgaussian
ws <- ahpgaussian(warships)
summary(ws)
```

warships

Decision Matrix

Description

A data.frame Decision Matrix of the data used Santos (2021), the first column lists the criteria, while the next three columns represent the alternatives and the last column represents the objective choice between minimum and maximum for a given criterion. Each model corresponds to an alternative of ship, classified according to its respective criteria.

Usage

```
data(warships)
```

Format

The format is:

```
'data.frame': 9 obs. of 5 variables:
 criteria: chr "Action Radius" "Fuel Endurance" "Autonomy" "Primary Cannon" ...
 model_1 : num 4000 11 30 25 1 0 290 592 6
 model_2 : num 9330 26 25 25 2 1 310 633 8
 model_3 : num 10660 30 35 120 2 ...
 min_max : chr "max" "max" "max" "max" ...
#
# Description
#
 criteria: Statement of the goal, decision criteria and alternatives.
 model_1: Replicate the current Corvette Barroso;
 model_2: Build a slightly modernized ship (2.600 ton corvette); or
 model_3: Build a model with more significant modernizations (3.000 ton corvette).
 min_max: Weights of criteria and alternatives.
```
