Package 'EBEN'

January 20, 2025

Type Package

Title Empirical Bayesian Elastic Net

Version 5.2

Date 2024-10-27

Maintainer Anhui Huang <anhuihuang@gmail.com>

Description Provides the Empirical Bayesian Elastic Net for handling multicollinearity in generalized linear regression models. As a special case of the 'EBglmnet' package (also available on CRAN), this package encourages a grouping effects to select relevant variables and estimate the corresponding non-zero effects.

Contents

EBEN–package   *Empirical Bayesian Elastic Net (EBEN)*

Description

Fast EBEN algorithms.
EBEN implements a normal and generalized gamma hierearchical priors.
(**) Two parameters (alpha, lambda) are equivalent with elastic net priors.
(**) When parameter alpha = 1, it is equivalent with EBlasso-NE (normal + exponential)
Two models are available for both methods:
(**) General linear regression model.
(**) Logistic regression model.
Multi-collinearity:
(**) for group of high correlated or collinear variables: EBEN identifies the group of variables estimates their effects together.
(**) group of variables can be selected together.
*Epistasis (two-way interactions) can be included for all models/priors
*model implemented with memory efficient c code.
*LAPACK/BLAS are used for most linear algebra computations.

BASIS   *An Example Data File for the Gauss Model*

Description

This is a 1000x481 sample feature matrix

Usage

```
data(BASIS)
```

Format

The format is: int [1:1000, 1:481] 0 -1 0 0 1 0 1 0 1 0 ...

Details

The data was simulated on a 2400cM chromosome, each column corresponded to an even spaced QTL

Source

Huang, A., Xu, S., and Cai, X. (2014). Empirical Bayesian elastic net for multiple quantitative trait locus mapping. Heredity 10.1038/hdy.2014.79

Examples

```
data(BASIS)
```

BASISbinomial *An Example Data File for the Binomial Model*

Description

This is a 500x481 sample feature matrix

Usage

```
data(BASISbinomial)
```

Format

The format is: int [1:500, 1:481] 0 -1 0 0 0 0 -1 -1 0 1 ...

Details

The data was simulated on a 2400cM chromosome, each column corresponded to an even spaced QTL

Examples

```
data(BASISbinomial)
```

EBelasticNet.Binomial *The EB Elastic Net Algorithm for Binomial Model with Normal-Gamma(NG) Prior Distribution*

Description

Generalized linear regression, normal-Gxponential (NG) hierarchical prior for regression coefficients

Usage

```
EBelasticNet.Binomial(BASIS, Target, lambda, alpha,Epis = FALSE,verbose = 0)
```

Arguments

BASIS	sample matrix; rows correspond to samples, columns correspond to features
Target	Class label of each individual, TAKES VALUES OF 0 OR 1
lambda	Hyperparameter controls degree of shrinkage; can be obtained via Cross Validation; lambda>0
alpha	Hyperparameter controls degree of shrinkage; can be obtained via Cross Validation; 0<alpha<1
Epis	TRUE or FALSE for including two-way interactions
verbose	0 or 1; 1: display message; 0 no message

Details

If Epis=TRUE, the program adds two-way interaction of K*(K-1)/2 more columns to BASIS

Value

weight	the none-zero regression coefficients: col1,col2 are the indices of the bases(main if equal); col3: coefficent value; col4: posterior variance; col5: t-value; col6: p-value
logLikelihood	log likelihood from the final regression coefficients
WaldScore	Wald Score
Intercept	Intercept
lambda	the hyperparameter; same as input lambda
alpha	the hyperparameter; same as input alpha

Author(s)

References

Huang A, Xu S, Cai X: Empirical Bayesian LASSO-logistic regression for multiple binary trait locus mapping. BMC genetics 2013, 14(1):5.

Examples

```
library(EBEN)
data(BASISbinomial)
data(yBinomial)
#reduce sample size to speed up the running time
n = 50;
k = 100;
N = length(yBinomial);
set  = sample(N,n);
```

```
BASIS = BASISbinomial[set,1:k];
y    = yBinomial[set];
output = EBelasticNet.Binomial(BASIS, y,lambda = 0.1,alpha = 0.5, Epis = FALSE,verbose = 5)
```

EBelasticNet.BinomialCV

Cross Validation (CV) Function to Determine Hyperparameter of the
EB_Elastic Net Algorithm for Binomial Model with Normal-Gamma
(NG) Prior Distribution

Description

Hyperparameter controls degree of shrinkage, and is obtained via Cross Validation (CV). This pro-
gram calculates the maximum lambda that allows one non-zero basis; and performs a search down
to 0.001*lambda_max at even steps. (20 steps)

Usage

```
EBelasticNet.BinomialCV(BASIS, Target, nFolds,foldId, Epis = FALSE, verbose = 0)
```

Arguments

BASIS	sample matrix; rows correspond to samples, columns correspond to features
Target	Class label of each individual, TAKES VALUES OF 0 OR 1
nFolds	number of n-fold cv
Epis	TRUE or FALSE for including two-way interactions
foldId	random assign samples to different folds
verbose	from 0 to 5; larger verbose displays more messages

Details

If Epis=TRUE, the program adds two-way interaction $K*(K-1)/2$ more columns to BASIS

Value

CrossValidation
                  col1: hyperparameter; col2: loglikelihood mean; standard ERROR of nfold
                  mean log likelihood

Lmabda_optimal   the optimal hyperparameter as computed

Alpha_optimal   the optimal hyperparameter as computed

Examples

```
## not run
library(EBEN)
data(BASISbinomial)
data(yBinomial)
#reduce sample size to speed up the running time
n = 50;
k = 100;
N = length(yBinomial);
set.seed(1)
set  = sample(N,n);
BASIS = BASISbinomial[set,1:k];
y  = yBinomial[set];
nFolds = 3
## Not run:
CV = EBelasticNet.BinomialCV(BASIS, y, nFolds = 3,Epis = FALSE)

## End(Not run)
```

EBelasticNet.Gaussian   *The EB Elastic Net Algorithm for Gaussian Model*

Description

General linear regression, normal-Gamma (NG) hierarchical prior for regression coefficients

Usage

```
EBelasticNet.Gaussian(BASIS, Target, lambda, alpha,Epis = FALSE,verbose = 0)
```

Arguments

BASIS	sample matrix; rows correspond to samples, columns correspond to features
Target	Response each individual
lambda	Hyperparameter controls degree of shrinkage; can be obtained via Cross Validation; lambda>0
alpha	Hyperparameter controls degree of shrinkage; can be obtained via Cross Validation; 0<alpha<1
Epis	TRUE or FALSE for including two-way interactions
verbose	0 or 1; 1: display message; 0 no message

Details

If Epis=TRUE, the program adds two-way interaction of K*(K-1)/2 more columns to BASIS

Value

weight	the none-zero regression coefficients: col1,col2 are the indices of the bases(main if equal); col3: coefficent value; col4: posterior variance; col5: t-value; col6: p-value
WaldScore	Wald Score
Intercept	Intercept
lambda	the hyperparameter; same as input lambda
alpha	the hyperparameter; same as input alpha

Examples

```
library(EBEN)
data(BASIS)
data(y)
n = 50;
k = 100;
BASIS = BASIS[1:n,1:k];
y  = y[1:n];
Blup = EBelasticNet.Gaussian(BASIS, y,lambda = 0.0072,alpha = 0.95, Epis = FALSE,verbose = 0)
betas  = Blup$weight
betas
```

EBelasticNet.GaussianCV

Cross Validation (CV) Function to Determine Hyperparameters of the EBEN Algorithm for Gaussian Model

---

Description

Hyperparameter controls degree of shrinkage, and is obtained via Cross Validation (CV). This program calculates the maximum lambda that allows one non-zero basis; and performs a search down to 0.0001*lambda_max at even steps. (20 steps)

Usage

```
EBelasticNet.GaussianCV(BASIS, Target, nFolds,foldId, Epis = FALSE, verbose = 0)
```

Arguments

BASIS	sample matrix; rows correspond to samples, columns correspond to features
Target	Response each individual
nFolds	number of n-fold cv
Epis	TRUE or FALSE for including two-way interactions
foldId	random assign samples to different folds
verbose	from 0 to 5; larger verbose displays more messages

Details

If Epis=TRUE, the program adds two-way interaction K*(K-1)/2 more columns to BASIS

Value

CrossValidation	
	col1: hyperparameter; col2: loglikelihood mean; standard ERROR of nfold mean log likelihood
Lmabda_optimal	the optimal hyperparameter as computed
Alpha_optimal	the optimal hyperparameter as computed

Examples

```
library(EBEN)
data(BASIS)
data(y)
#reduce sample size to speed up the running time
n = 50;
k = 100;
BASIS = BASIS[1:n,1:k];
```

```
y  = y[1:n];
## Not run:
CV = EBelasticNet.GaussianCV(BASIS, y, nFolds = 3,Epis = FALSE)

## End(Not run)
```

EBlassoNEG.Binomial *The EBlasso Algorithm for Binomial Model with Normal-Exponential-Gamma (NEG) Prior Distribution*

Description

Generalized linear regression, normal-exponential-gamma (NEG) hierarchical prior for regression coefficients

Usage

```
EBlassoNEG.Binomial(BASIS, Target, a_gamma, b_gamma, Epis,verbose,group)
```

Arguments

BASIS	sample matrix; rows correspond to samples, columns correspond to features
Target	Class label of each individual, TAKES VALUES OF 0 OR 1
a_gamma	Hyperparameters control degree of shrinkage; can be obtained via Cross Validation; a_gamma>=-1
b_gamma	Hyperparameters control degree of shrinkage; can be obtained via Cross Validation; b_gamma>0
Epis	TRUE or FALSE for including two-way interactions
verbose	0 or 1; 1: display message; 0 no message
group	0 or 1; 0: No group effect; 1 two-way interaction grouped. Only valid when Epis = TRUE

Details

If Epis=TRUE, the program adds two-way interaction $K*(K-1)/2$ more columns to BASIS

Value

weight	the none-zero regression coefficients: col1,col2 are the indices of the bases(main if equal); col3: coeffient value; col4: posterior variance; col5: t-value; col6: p-value
logLikelihood	log likelihood with the final regression coefficients

WaldScore	Wald Score
Intercept	Intercept
a_gamma	the hyperparameter; same as input
b_gamma	the hyperparameter; same as input

Author(s)

Anhui Huang; Dept of Electrical and Computer Engineering, Univ of Miami, Coral Gables, FL

References

Huang, A., Xu, S., and Cai, X.(2012). Empirical Bayesian LASSO-logistic regression for multiple binary trait locus mapping. BMC Genetics. Submitted

Examples

```
library(EBEN)
data(BASISbinomial)
data(yBinomial)
#reduce sample size to speed up the running time
n = 50;
k = 100;
BASIS = BASISbinomial[1:n,1:k];
y   = yBinomial[1:n];
output = EBlassoNEG.Binomial(BASIS,y,0.1,0.1,Epis = FALSE)
```

EBlassoNEG.BinomialCV	*Cross Validation (CV) Function to Determine Hyperparameters of the EBlasso Algorithm for Binomial Model with Normal-Exponential-Gamma (NEG) Prior Distribution*

Description

Hyperparameters control degree of shrinkage, and are obtained via Cross Validation. This program performs three steps of CV.
1st: a = b = 0.001, 0.01, 0.1, 1;
2nd: fix b= b1; a=[-0.5, -0.4, -0.3, -0.2, -0.1, -0.01, 0.01, 0.05, 0.1, 0.5, 1];
3rd: fix a = a2; b= 0.01 to 10 with a step size of one for b > 1 and a step size of one on the logarithmic scale for b < 1
In the 2nd step, a can take value from -1 and values in [-1, -0.5] can be added to the set in line 13 of this function (The smaller a is, the less shrinkage.)

Usage

```
EBlassoNEG.BinomialCV(BASIS, Target, nFolds,foldId, Epis,verbose, group)
```

Arguments

BASIS	sample matrix; rows correspond to samples, columns correspond to features
Target	Class label of each individual, TAKES VALUES OF 0 OR 1
nFolds	number of n-fold cv
foldId	random assign samples to different folds
Epis	TRUE or FALSE for including two-way interactions
verbose	from 0 to 5; larger verbose displays more messages
group	TRUE or FALSE; FALSE: No group effect; TRUE two-way interaction grouped. Only valid when Epis = TRUE

Details

If Epis=TRUE, the program adds two-way interaction K*(K-1)/2 more columns to BASIS
Note: Given the fact that degree of shrinkage is a monotonic function of (a,b),
The function implemented a 3-step search as described in Huang, A. 2014, for full
grid search, user needs to modify the function accordingly.

Value

CrossValidation

> col1: hyperparameters; col2: loglikelihood mean; standard ERROR of nfold mean log likelihood

a_optimal	the optimal hyperparameter as computed
b_optimal	the optimal hyperparameter as computed

Examples

```
library(EBEN)
data(BASISbinomial)
data(yBinomial)
#reduce sample size to speed up the running time
n = 50;
k = 100;
BASIS = BASISbinomial[1:n,1:k];
y  = yBinomial[1:n];
## Not run:
CV = EBlassoNEG.BinomialCV(BASIS, y, nFolds = 3,Epis = FALSE, verbose = 0)
```

```
## End(Not run)
```

EBlassoNEG.Gaussian | *The EBlasso Algorithm for Gaussian Model with Normal-Exponential-Gamma (NEG) Prior Distribution*

Description

General linear regression, normal-exponential-gamma (NEG) hierarchical prior for regression coefficients

Usage

```
EBlassoNEG.Gaussian(BASIS, Target, a_gamma, b_gamma, Epis, verbose, group)
```

Arguments

BASIS   sample matrix; rows correspond to samples, columns correspond to features

Target   Response each individual

a_gamma   Hyperparameters control degree of shrinkage; can be obtained via Cross Validation

b_gamma   Hyperparameters control degree of shrinkage; can be obtained via Cross Validation

Epis   TRUE or FALSE for including two-way interactions

verbose   from 0 to 5; larger verbose displays more messages

group   0 or 1; 0: No group effect; 1 two-way interaction grouped. Only valid when Epis = TRUE

Details

If Epis=TURE, the program adds two-way interaction K*(K-1)/2 more columns to BASIS
for memory efficient, the function pass n_effect to C. n_effect > n_true effects, which is
a rough guess on how many variables will be selected by the function
by providing a relative 'small' n_effect, the function will not allocate
a large trunck of memory during computation.

Value

weight   the none-zero regression coefficients:
                 col1,col2 are the indices of the bases(main if equal);
                 col3: coefficent value;
                 col4: posterior variance;
                 col5: t-value;
                 col6: p-value

WaldScore	Wald Score
Intercept	Intercept
residVar	residual variance
a_gamma	the hyperparameter; same as input
b_gamma	the hyperparameter; same as input

Examples

```
library(EBEN)
data(BASIS)
data(y)
n = 50;
k = 100;
BASIS = BASIS[1:n,1:k];
y  = y[1:n];
output = EBlassoNEG.Gaussian(BASIS, y, a_gamma = 0.1, b_gamma = 0.1)
```

EBlassoNEG.GaussianCV	*Cross Validation (CV) Function to Determine Hyperparameters of the EBlasso Algorithm for Gaussian Model with Normal-Exponential-Gamma (NEG) Prior Distribution*

Description

Hyperparameters control degree of shrinkage, and are obtained via Cross Validation. This program performs three steps of CV.
1st: a = b = 0.001, 0.01, 0.1, 1;
2nd: fix b= b1; a=[-0.5, -0.4, -0.3, -0.2, -0.1, -0.01, 0.01, 0.05, 0.1, 0.5, 1];
3rd: fix a = a2; b= 0.01 to 10 with a step size of one for b > 1 and a step size of one on the logarithmic scale for b < 1
In the 2nd step, a can take value from -1 and values in [-1, -0.5] can be added to the set in line 13 of this function (The smaller a is, the less shrinkage.)

Usage

```
EBlassoNEG.GaussianCV(BASIS, Target, nFolds, foldId, Epis,verbose, group)
```

Arguments

BASIS	sample matrix; rows correspond to samples, columns correspond to features
Target	Class label of each individual, TAKES VALUES OF 0 OR 1
nFolds	number of n-fold cv
foldId	random assign samples to different folds
Epis	TRUE or FALSE for including two-way interactions
verbose	from 0 to 5; larger verbose displays more messages
group	TRUE or FALSE; FALSE: No group effect; TRUE two-way interaction grouped. Only valid when Epis = TRUE

Details

If Epis= TRUE, the program adds two-way interaction K*(K-1)/2 more columns to BASIS
Note: Given the fact that degree of shrinkage is a monotonic function of (a,b),
The function implemented a 3-step search as described in Huang, A. 2014, for full
grid search, user needs to modify the function accordingly.

Value

CrossValidation

> col1: hyperparameters; col2: loglikelihood mean; standard ERROR of nfold mean log likelihood

a_optimal	the optimal hyperparameter as computed
b_optimal	the optimal hyperparameter as computed
