Package 'EstimationTools'

<div align="center">January 20, 2025</div>

Type Package

Title Maximum Likelihood Estimation for Probability Functions from
Data Sets

Version 4.0.0

Depends R (>= 3.5.0), survival, DEoptim, BBmisc, GA, gaussquad

Imports Rdpack, utils, stats, numDeriv, boot, autoimage, graphics,
stringr

RdMacros Rdpack

Suggests gamlss.dist, knitr, rmarkdown, AdequacyModel, readr, covr,
testthat (>= 3.0.0), vdiffr, spelling, lifecycle, matrixStats,
lintr, V8

VignetteBuilder knitr, utils

Description Total Time on Test plot and routines for parameter estimation of
any lifetime distribution implemented in R via maximum likelihood (ML) given
a data set. It is implemented thinking on parametric survival analysis, but
it feasible to use in parameter estimation of probability density or mass
functions in any field. The main routines 'maxlogL' and 'maxlogLreg' are
wrapper functions specifically developed for ML estimation. There are
included optimization procedures such as 'nlminb' and 'optim' from base
package, and 'DEoptim' Mullen (2011) <doi:10.18637/jss.v040.i06>. Standard
errors are estimated with 'numDeriv' Gilbert (2011)
<https://CRAN.R-project.org/package=numDeriv> or the option 'Hessian = TRUE'
of 'optim' function.

Contents

| bootstrap_maxlogL | *Bootstrap computation of standard error for* maxlogL *class objects.* |

Description

[Experimental]

bootstrap_maxlogL computes standard errors of maxlogL class objects by non-parametric bootstrap.

Usage

```
bootstrap_maxlogL(object, R = 2000, silent = FALSE, ...)
```

Arguments

object	an object of maxlogL class whose standard errors are going to be computed by bootstrap.
R	numeric. It is the number of resamples performed with the dataset in bootstrap computation. Default value is 2000.
silent	logical. If TRUE, notifications of bootstrap_maxlogL are suppressed.
...	arguments passed to boot used in this routine for estimation of standard errors.

Details

The computation performed by this function may be invoked when Hessian from optim and hessian fail in maxlogL or in maxlogLreg.

However, this function can be run even if Hessian matrix calculation does not fails. In this case, standard errors in the maxlogL class object is replaced.

Value

A modified object of class maxlogL.

Author(s)

Jaime Mosquera Gutiérrez, <jmosquerag@unal.edu.co>

coef.maxlogL	*Extract Model Coefficients in a* maxlogL *Fits*

Description

[Maturing]

coef.maxlogL is the specific method for the generic function coef which extracts model coefficients from objects returned by [maxlogLreg](#). coefficients is an alias for coef.

Usage

```
## S3 method for class 'maxlogL'
coef(object, parameter = object$outputs$par_names, ...)

coefMany(object, parameter = NULL, ...)
```

Arguments

object	an object of maxlogL class generated by [maxlogLreg](#) function.
parameter	a character which specifies the parameter is required. In coefMany this argument can be an atomic vector with two or more names of parameters.
...	other arguments.

Value

A named vector with coefficients of the specified distribution parameter.

Author(s)

Jaime Mosquera Gutiérrez, <jmosquerag@unal.edu.co>

Examples

```
library(EstimationTools)

#-------------------------------------------------------------------------------
# Example 1: coefficients from a model using a simulated normal distribution
n <- 1000
x <- runif(n = n, -5, 6)
y <- rnorm(n = n, mean = -2 + 3 * x, sd = exp(1 + 0.3* x))
norm_data <- data.frame(y = y, x = x)

# It does not matter the order of distribution parameters
formulas <- list(sd.fo = ~ x, mean.fo = ~ x)

norm_mod <- maxlogLreg(formulas, y_dist = y ~ dnorm, data = norm_data,
                       link = list(over = "sd", fun = "log_link"))
coef(norm_mod)
coef(norm_mod, parameter = 'sd')
a <- coefMany(norm_mod, parameter = c('mean', 'sd'))
b <- coefMany(norm_mod)
identical(a, b)

#-------------------------------------------------------------------------------
# Example 2: Parameters in estimation with one fixed parameter
x <- rnorm(n = 10000, mean = 160, sd = 6)
theta_1 <- maxlogL(x = x, dist = 'dnorm', control = list(trace = 1),
                link = list(over = "sd", fun = "log_link"),
                fixed = list(mean = 160))
coef(theta_1)

#-------------------------------------------------------------------------------
```

Fibers   *Tensile strengths*

Description

Tensile strengths (in GPa) of 69 specimens of carbon fiber tested under tension at gauge lengths of 20 mm.

Usage

```
Fibers
```

Format

A data frame with 69 observations.

gauss_quad   *Numerical integration through Gaussian Quadrature*

Description

[Experimental]

This family of functions use quadratures for solving integrals. The user can create a custom integration routine, see *details* for further information.

Usage

```
gauss_quad(
  fun,
  lower,
  upper,
  kind = "legendre",
  n = 10,
  normalized = FALSE,
  ...
)
```

Arguments

fun	an **R** function which should take a numeric argument x and possibly some parameters. The function returns a numerical vector value for the given argument x.
lower	a numeric value for the lower limit of the integral.
upper	a numeric value for the upper limit of the integral.

kind	character specifying the weight (polynomial) function for the quadrature.
n	integer with the highest order of the polynomial of the selected rule.
normalized	logical. If TRUE, rules are for orthonormal polynomials, otherwise they are for orthogonal polynomials.
...	additional arguments to be passed to fun and to the quadrature routine specified in argument kind.

Details

gauss_quad uses the implementation of Gaussian quadratures from **gaussquad** package. This is a wrapper that implements rules and integration routine in the same place.

Value

The value of the integral of the function specified in fun argument.

Author(s)

Jaime Mosquera Gutiérrez, <jmosquerag@unal.edu.co>

Examples

```
library(EstimationTools)

#------------------------------------------------------------------------------
# Example 1: Mean of X ~ N(2,1) (Gauss-Hermitie quadrature).
g <- function(x, mu, sigma) sqrt(2)*sigma*x + mu
i2 <- gauss_quad(g, lower = -Inf, upper = Inf, kind = 'hermite.h',
                 normalized = FALSE, mu = 2, sigma = 1)
i2 <- i2/sqrt(pi)
i2

#------------------------------------------------------------------------------
```

---

half_norm_key   *Half normal key function*

Description

[Experimental]

This function provides the half normal key function for model fitting in distance sampling.

Usage

```
half_norm_key(x, sigma)
```

Arguments

x	vector of perpendicular distances from the transect.
sigma	scale parameter.

Details

This is the half normal key function with parameter `sigma`. Its expression is given by

$g(x) = \exp(\frac{-x^2}{2*\sigma^2}$,

for x > 0.

Value

A numeric value corresponding to a given value of x and `sigma`.

Author(s)

Jaime Mosquera Gutiérrez, <jmosquerag@unal.edu.co>

See Also

Other key functions: hazard_rate_key(), uniform_key()

Examples

```
library(EstimationTools)

#----------------------------------------------------------------------------
# Example: Half normal function
half_norm_key(x=1, sigma=4.1058)
curve(half_norm_key(x, sigma=4.1058), from=0, to=20, ylab='g(x)')

#----------------------------------------------------------------------------
```

Description

[Experimental]

This function takes the name of a probability density/mass function as an argument and creates a hazard function.

Usage

```
hazard_fun(dist, support)
```

Arguments

dist   a length-one character vector with the name of density/mass function of interest.

support   a list with the following entries:

- `interval`: a two dimensional atomic vector indicating the set of possible values of a random variable having the distribution specified in `y_dist`.
- `type`: character indicating if distribution has a `discrete` or a `continous` random variable.

Value

A function with the folling input arguments:

x   vector of (non-negative) quantiles.

...   Arguments of the probability density/mass function.

Other maxlogL: [maxlogLreg](), [maxlogL]()

Examples

```
library(EstimationTools)

#-----------------------------------------------------------------------------
# Example 1: Hazard function of Weibull distribution.
hweibull1 <- hazard_fun('dweibull', list(interval=c(0, Inf), type='continuous'))
hweibull2 <- function(x){
  ans <- dweibull(x, shape = 2, scale = 1)/
    pweibull(x, shape = 2, scale = 1, lower.tail = FALSE)
```

```
   ans
}
hweibull1(0.2, shape = 2, scale = 1)
hweibull2(0.2)

#-----------------------------------------------------------------------------
```

---

hazard_rate_key   *Hazard rate key function*

Description

[Experimental]

This function provides the hazard rate key function for model fitting in distance sampling.

Usage

```
hazard_rate_key(x, sigma, beta)
```

Arguments

x	vector of perpendicular distances from the transect.
sigma	scale parameter.
beta	shape parameter.

Details

This is the hazard rate key function with parameters `sigma` and `beta`. Its expression is given by

$g(x) = 1 - \exp((\frac{-x}{\sigma})^{-\beta},$

for x > 0.

Value

A numeric value corresponding to a given value of `x`, `sigma` and `beta`.

Author(s)

Jaime Mosquera Gutiérrez, <jmosquerag@unal.edu.co>

See Also

Other key functions: [half_norm_key](), [uniform_key]()

Examples

```

curve(hazard_rate_key(x, sigma=2, beta=3), from=0, to=10, ylab='g(x)')

#----------------------------------------------------------------------------
```

---

integration	*Integration*

Description

[Experimental]

This is a wrapper routine for integration in maxlogL framework. It is used in integration for compute detectability density functions and in computation of mean values, but it is also a general purpose integrator.

Usage

```
integration(fun, lower, upper, routine = "integrate", ...)
```

Arguments

fun	an **R** function which should take a numeric argument x and possibly some parameters. The function returns a numerical vector value for the given argument x.
lower	a numeric value for the lower limit of the integral.
upper	a numeric value for the upper limit of the integral.
routine	a character specifying the integration routine. integrate and gauss_quad are available, but the custom routines can be defined.
...	additional arguments to be passed to fun and to the integration routine specified in routine argument.

Details

The user can create custom integration routines through implementation of a wrapper function using three arguments

- funa function which should take a numeric argument x and possibly some parameters.
- lowera numeric value for the lower limit of the integral.
- uppera numeric value for the upper limit of the integral.
- ...furthermore, the user must define additional arguments to be passed to fun.

The output must be a numeric atomic value with the result of the integral.

interp.options	*Configure various aspects of interpolating function in* TTT_hazard_shape

---

Description

[Maturing]

This function allows the user to set the parameters of any of the following interpolating functions which can be used inside [TTT_hazard_shape]().

Usage

```
interp.options(interp.fun = "splinefun", length.out = 10, ...)
```

Arguments

`interp.fun`	character. This argument defines the interpolating function used. Default value is "splinefun". Visit the **Details** section for further information.
`length.out`	numeric. Number of points interpolated. Default value is 10.
`...`	further arguments passed to the interpolating function.

Details

Each interpolating function has its particular arguments. The following interpolating functions are recommended:

- `approxfun`
- `splinefun`
- `spline`

The user can also implement a custom interpolating function.

Author(s)

Jaime Mosquera Gutiérrez <jmosquerag@unal.edu.co>

`is.maxlogL`	*Is return of any object of* EstimationTools*?*

Description

[Stable]

Checks if an object is any of the classes implemented in EstimationTools package.

Usage

```
is.maxlogL(x)

is.EmpiricalTTT(x)

is.HazardShape(x)
```

Arguments

x   Any object of `EstimationTools`.

Author(s)

Jaime Mosquera Gutiérrez <jmosquerag@unal.edu.co>

---

legend.HazardShape   *Customize legend for* `plot.HazardShape` *outputs*

Description

[Maturing]

Put legend after run `plot.HazardShape` function.

Usage

```
legend.HazardShape(
  x,
  y = NULL,
  legend = c("Empirical TTT", "Spline curve"),
  fill = NULL,
  col = 1,
  border = "white",
  lty = NA,
  lwd = NA,
  pch = c(1, NA),
  angle = 45,
  density = NULL,
  bty = "o",
  bg = par("bg"),
  box.lwd = par("lwd"),
  box.lty = par("lty"),
  box.col = par("fg"),
  pt.bg = NA,
  cex = 1,
  pt.cex = cex,
  pt.lwd = lwd,
  xjust = 0,
  yjust = 1,
  x.intersp = 1,
  y.intersp = 1,
  adj = c(0, 0.5),
  text.width = NULL,
  text.col = par("col"),
  text.font = NULL,
```

```
    merge = TRUE,
    trace = FALSE,
    plot = TRUE,
    ncol = 1,
    horiz = FALSE,
    title = NULL,
    inset = 0,
    xpd = TRUE,
    title.col = text.col[1],
    title.adj = 0.5,
    title.cex = cex[1],
    title.font = text.font[1],
    seg.len = 2,
    curve_options = list(col = 2, lwd = 2, lty = 1)
)
```

Arguments

x, y	the x and y co-ordinates to be used to position the legend. They can be specified by keyword or in any way which is accepted by `xy.coords`: See 'Details'.
legend	a character or expression vector of length ≥ 1 to appear in the legend. Other objects will be coerced by `as.graphicsAnnot`.
fill	if specified, this argument will cause boxes filled with the specified colors (or shaded in the specified colors) to appear beside the legend text.
col	the color of points or lines appearing in the legend.
border	the border color for the boxes (used only if `fill` is specified).
lty, lwd	the line types and widths for lines appearing in the legend. One of these two *must* be specified for line drawing.
pch	the plotting symbols appearing in the legend, as numeric vector or a vector of 1-character strings (see points). Unlike points, this can all be specified as a single multi-character string. *Must* be specified for symbol drawing.
angle	angle of shading lines.
density	the density of shading lines, if numeric and positive. If NULL or negative or NA color filling is assumed.
bty	the type of box to be drawn around the legend. The allowed values are `"o"` (the default) and `"n"`.
bg	the background color for the legend box. (Note that this is only used if `bty != "n"`.)
box.lty, box.lwd, box.col	
	the line type, width and color for the legend box (if `bty = "o"`).
pt.bg	the background color for the points, corresponding to its argument bg.
cex	character expansion factor **relative** to current `par("cex")`. Used for text, and provides the default for pt.cex.
pt.cex	expansion factor(s) for the points.

pt.lwd	line width for the points, defaults to the one for lines, or if that is not set, to par("lwd").
xjust	how the legend is to be justified relative to the legend x location. A value of 0 means left justified, 0.5 means centered and 1 means right justified.
yjust	the same as xjust for the legend y location.
x.intersp	character interspacing factor for horizontal (x) spacing between symbol and legend text.
y.intersp	vertical (y) distances (in lines of text shared above/below each legend entry). A vector with one element for each row of the legend can be used.
adj	numeric of length 1 or 2; the string adjustment for legend text. Useful for y-adjustment when labels are [plotmath](#) expressions.
text.width	the width of the legend text in x ("user") coordinates. (Should be positive even for a reversed x axis.) Can be a single positive numeric value (same width for each column of the legend), a vector (one element for each column of the legend), NULL (default) for computing a proper maximum value of [strwidth](#)(legend)), or NA for computing a proper column wise maximum value of [strwidth](#)(legend)).
text.col	the color used for the legend text.
text.font	the font used for the legend text, see [text](#).
merge	logical; if TRUE, merge points and lines but not filled boxes. Defaults to TRUE if there are points and lines.
trace	logical; if TRUE, shows how legend does all its magical computations.
plot	logical. If FALSE, nothing is plotted but the sizes are returned.
ncol	the number of columns in which to set the legend items (default is 1, a vertical legend).
horiz	logical; if TRUE, set the legend horizontally rather than vertically (specifying horiz overrides the ncol specification).
title	a character string or length-one expression giving a title to be placed at the top of the legend. Other objects will be coerced by [as.graphicsAnnot](#).
inset	inset distance(s) from the margins as a fraction of the plot region when legend is placed by keyword.
xpd	if supplied, a value of the [graphical parameter](#) xpd to be used while the legend is being drawn.
title.col	color for title, defaults to text.col[1].
title.adj	horizontal adjustment for title: see the help for [par](#)("adj").
title.cex	expansion factor(s) for the title, defaults to cex[1].
title.font	the font used for the legend title, defaults to text.font[1], see [text](#).
seg.len	the length of lines drawn to illustrate lty and/or lwd (in units of character widths).
curve_options	a list whose names are curve graphical parameters, and whose values are the corresponding graphical parameters values.

Details

This function is a wrapper for the legend function. It just adds two features:

- `legend` has a default value, regarding that `HazardShape` objects produces the TTT plot and its LOESS estimation.
- `curve_options` is used to set legend parameters for the LOESS curve. We encourage you to define first a list with curve parameters, and then pass it to plot.HazardShape and `legend.HazardShape` (see example 2).

  cex.lab=1.8,
  cex.axis=1.8,
  mar=c(4.8,5.4,1,1),
  las = 1,
  mgp=c(3.4,1,0)
)
plot(HS_IG, pch = 16, cex = 1.8)

# Finally, put the legend
legend.HazardShape(
  x = "bottomright",
  box.lwd = NA,
  cex = 1.8,
  pt.cex = 1.8,
  bty = 'n',
  pch = c(16, NA)
)
#-----------------------------------------------------------------------------
# Example 2: example 1 with custom options for the curve

# This is the list with curve parameters
loess_options <- list(
  col = 3, lwd = 4, lty = 2
)
```

```
par(
  cex.lab=1.8,
  cex.axis=1.8,
  mar=c(4.8,5.4,1,1),
  las = 1,
  mgp=c(3.4,1,0)
)

plot(HS_IG, pch = 16, cex = 1.8, curve_options = loess_options)
legend.HazardShape(
  x = "bottomright",
  box.lwd = NA,
  cex = 1.8,
  pt.cex = 1.8,
  bty = 'n',
  pch = c(16, NA),
  curve_options = loess_options
)
```

---

loess.options   *Configure various aspects of LOESS in* TTT_hazard_shape

---

Description

[Maturing]

This function allows the user to set the parameters of loess function used inside TTT_hazard_shape.

Usage

```
loess.options(span = 2/3, ...)
```

Arguments

span   the parameter which controls the degree of smoothing.

...   further arguments passed to [loess](#) function.

Details

Please, visit [loess](#) to know further possible arguments. The following arguments are not available for passing to the LOESS estimation:

- dataThe only data handled inside TTT_hazard_shape is the computed empirical TTT.
- subsetThis argument is used in loess to take a subset of data. In this context, it is not necessary.

logit_link   *Logit link function (for estimation with* maxlogL *object)*

Description

[Experimental]

log_link object provides a way to implement logit link function that maxlogL needs to perform estimation. See documentation for maxlogL for further information on parameter estimation and implementation of link objects.

Usage

```
logit_link()
```

Details

logit_link is part of a family of generic functions with no input arguments that defines and returns a list with details of the link function:

1. name: a character string with the name of the link function.

2. g: implementation of the link function as a generic function in R.

3. g_inv: implementation of the inverse link function as a generic function in R.

There is a way to add new mapping functions. The user must specify the details aforesaid.

Value

A list with logit link function, its inverse and its name.

```

---

maxlogL   *Maximum Likelihood Estimation for parametric distributions*

Description

[Maturing]

Wrapper function to compute maximum likelihood estimators (MLE) of any distribution implemented in R.

Usage

```
maxlogL(
  x,
  dist = "dnorm",
  fixed = NULL,
  link = NULL,
  start = NULL,
  lower = NULL,
  upper = NULL,
```

```
    optimizer = "nlminb",
    control = NULL,
    StdE_method = c("optim", "numDeriv"),
    silent = FALSE,
    ...
)
```

Arguments

x	a vector with data to be fitted. This argument must be a matrix with hierarchical distributions.
dist	a length-one character vector with the name of density/mass function of interest. The default value is 'dnorm', to compute maximum likelihood estimators of normal distribution.
fixed	a list with fixed/known parameters of distribution of interest. Fixed parameters must be passed with its name.
link	a list with names of parameters to be linked, and names of the link function object. For names of parameters, please visit documentation of density/mass function. There are three link functions available: log_link, logit_link and NegInv_link.
start	a numeric vector with initial values for the parameters to be estimated.
lower	a numeric vector with lower bounds, with the same length of argument start (for box-constrained optimization).
upper	a numeric vector with upper bounds, with the same length of argument start (for box-constrained optimization).
optimizer	a length-one character vector with the name of optimization routine. nlminb, optim, DEoptim and gaare available; custom optimization routines can also be implemented. nlminb is the default routine.
control	control parameters of the optimization routine. Please, visit documentation of selected optimizer for further information.
StdE_method	a length-one character vector with the routine for Hessian matrix computation. The This is needed for standard error estimation. The options available are "optim" and "numDeriv". For further information, visit optim or hessian.
silent	logical. If TRUE, warnings of maxlogL are suppressed.
...	further arguments to be supplied to the optimizer.

Details

maxlogL computes the likelihood function corresponding to the distribution specified in argument dist and maximizes it through optim, nlminb or DEoptim. maxlogL generates an S3 object of class maxlogL.

Noncentrality parameters must be named as ncp in the distribution.

Value

A list with class `"maxlogL"` containing the following lists:

`fit`	A list with output information about estimation.
`inputs`	A list with all input arguments.
`outputs`	A list with some output additional information:

- Number of parameters.
- Sample size
- Standard error computation method.

Note

The following generic functions can be used with a `maxlogL` object: `summary`, `print`, `AIC`, `BIC`, `logLik`.

maxlogLreg   *Maximum Likelihood Estimation for parametric linear regression models*

Description

[Experimental]

Function to compute maximum likelihood estimators (MLE) of regression parameters of any distribution implemented in R with covariates (linear predictors).

Usage

```
maxlogLreg(
  formulas,
  y_dist,
  support = NULL,
  data = NULL,
  subset = NULL,
  fixed = NULL,
  link = NULL,
  start = NULL,
  lower = NULL,
  upper = NULL,
  optimizer = "nlminb",
  control = NULL,
  silent = FALSE,
  StdE_method = c("optim", "numDeriv"),
  ...
)
```

Arguments

formulas	a list of formula objects. Each element must have an ~, with the terms on the right separated by + operators. The response variable on the left side is optional. Linear predictor of each parameter must be specified with the name of the parameter followed by the suffix '.fo'. See the examples below for further illustration.
y_dist	a formula object that specifies the distribution of the response variable. On the left side of ~ must be the response, and in the right side must be the name o de probability density/mass function. See the section **Details** and the examples below for further illustration.
support	a list with the following entries: - interval: a two dimensional atomic vector indicating the set of possible values of a random variable having the distribution specified in y_dist. - type: character indicating if distribution has a discrete or a continous random variable.
data	an optional data frame containing the variables in the model. If data is not specified, the variables are taken from the environment from which maxlogLreg is called.
subset	an optional vector specifying a subset of observations to be used in the fitting process.
fixed	a list with fixed/known parameters of distribution of interest. Fixed parameters must be passed with its name and its value (known).

link	a list with names of parameters to be linked, and names of the link function object. For names of parameters, please visit documentation of density/mass function. There are three link functions available: log_link, logit_link and NegInv_link. Take into account: the order used in argument over corresponds to the order in argument link.
start	a numeric vector with initial values for the parameters to be estimated. Zero is the default value.
lower	a numeric vector with lower bounds, with the same lenght of argument start (for box-constrained optimization). -Inf is the default value.
upper	a numeric vector with upper bounds, with the same lenght of argument start (for box-constrained optimization). Inf is the default value.
optimizer	a length-one character vector with the name of optimization routine. nlminb, optim and DEoptim are available; nlminb is the default routine.
control	control parameters of the optimization routine. Please, visit documentation of selected optimizer for further information.
silent	logical. If TRUE, warnings of maxlogL are suppressed.
StdE_method	a length-one character vector with the routine for Hessian matrix computation. The This is needed for standard error estimation. The options available are "optim" and "numDeriv". For further information, visit optim or hessian.
...	Further arguments to be supplied to the optimization routine.

Details

maxlogLreg computes programmatically the log-likelihood (log L) function corresponding for the following model:

$$y_i \overset{iid.}{\sim} \mathcal{D}(\theta_{i1}, \theta_{i2}, \ldots, \theta_{ij}, \ldots, \theta_{ik})$$

$$g(\boldsymbol{\theta}_j) = \boldsymbol{\eta}_j = \mathbf{X}_j^\top \boldsymbol{\beta}_j,$$

where,

- $g_k(\cdot)$ is the k-th link function.
- $\boldsymbol{\eta}_j$ is the value of the linear predictor for the jth for all the observations.
- $\boldsymbol{\beta}_j = (\beta_{0j}, \beta_{1j}, \ldots, \beta_{(p_j-1)j})^\top$ are the fixed effects vector, where p_j is the number of parameters in linear predictor j and $\mathbf{X}_j$ is a known design matrix of order $n \times p_j$. These terms are specified in formulas argument.
- $\mathcal{D}$ is the distribution specified in argument y_dist.

Then, maxlogLreg maximizes the log L through optim, nlminb or DEoptim. maxlogLreg generates an S3 object of class maxlogL.

Estimation with censorship can be handled with Surv objects (see example 2). The output object stores the corresponding censorship matrix, defined as $r_{il} = 1$ if sample unit i has status l, or $r_{il} = 0$ in other case. $i = 1, 2, \ldots, n$ and $l = 1, 2, 3$ ($l = 1$: observation status, $l = 2$: right censorship status, $l = 3$: left censorship status).

Value

A list with class `maxlogL` containing the following lists:

fit
: A list with output information about estimation and method used.

inputs
: A list with all input arguments.

outputs
: A list with additional information. The most important outputs are:

  - `npar`: number of parameters.
  - `n`: sample size
  - `Stde_method`: standard error computation method.
  - `b_lenght`: a list with the number of regression parameters.
  - `design_matrix`: a list with the $\mathbf{X}$ matrix for each parameter, the response values (called `y`) and the censorship matrix (called `status`). See the Details section for further information.

Note

- The following generic functions can be used with a `maxlogL` object: `summary`, `print`, `logLik`, `AIC`.
- Noncentrality parameters must be named as `ncp` in the distribution.

NegInv_link   *Negative inverse link function (for estimation with* maxlogL *object)*

Description

NegInv_link object provides a way to implement negative inverse link function that [maxlogL](#) needs to perform estimation. See documentation for [maxlogL](#) for further information on parameter estimation and implementation of link objects.

Usage

```
NegInv_link()
```

Details

NegInv_link is part of a family of generic functions with no input arguments that defines and returns a list with details of the link function:

1. name: a character string with the name of the link function.

2. g: implementation of the link function as a generic function in R.

3. g_inv: implementation of the inverse link function as a generic function in R.

There is a way to add new mapping functions. The user must specify the details aforesaid.

Value

A list with negative inverse link function, its inverse and its name.

See Also

[maxlogL](#)

Other link functions: [log_link](#)(), [logit_link](#)()

Examples

```
# Estimation of rate parameter in exponential distribution
T <- rexp(n = 1000, rate = 3)
lambda <- maxlogL(x = T, dist = "dexp", start = 5,
                  link = list(over = "rate", fun = "NegInv_link"))
summary(lambda)

# Link function name
fun <- NegInv_link()$name
print(fun)

# Link function
g <- NegInv_link()$g
curve(g(x), from = 0.1, to = 1)
```

```
# Inverse link function
ginv <- NegInv_link()$g_inv
curve(ginv(x), from = 0.1, to = 1)
```

---

plot.EmpiricalTTT   *Plot method for* EmpiricalTTT *objects*

Description

[Experimental]

Draws a TTT plot of an EmpiricalTTT object, one for each strata.

TTT plots are graphed in the same order in which they appear in the list element strata or in the list element phi_n of the EmpiricalTTT object.

Usage

```
## S3 method for class 'EmpiricalTTT'
plot(
  x,
  add = FALSE,
  grid = FALSE,
  type = "l",
  pch = 1,
  xlab = "i/n",
  ylab = expression(phi[n](i/n)),
  ...
)
```

Arguments

x	an object of class EmpiricalTTT.
add	logical. If TRUE, plot.EmpiricalTTT add a TTT plot to an already existing plot.
grid	logical. If TRUE, plot appears with grid.
type	character string (length 1 vector) or vector of 1-character strings indicating the type of plot for each TTT graph. See [plot](#).
pch	numeric (integer). A vector of plotting characters or symbols when type = "p". See [points](#).
xlab, ylab	titles for x and y axes, as in [plot](#).
...	further arguments passed to [matplot](#). See the examples and **Details** section for further information.

Details

This method is based on matplot. Our function sets some default values for graphic parameters: type = "l", pch = 1, xlab = "i/n" and ylab = expression(phi[n](i/n)). This arguments can be modified by the user.

plot.HazardShape   *Plot of* HazardShape *objects*

Description

[Maturing]

Draws the empirical total time on test (TTT) plot and its non-parametric (LOESS) estimated curve useful for identifying hazard shape.

Usage

```
## S3 method for class 'HazardShape'
plot(
  x,
  xlab = "i/n",
  ylab = expression(phi[n](i/n)),
  xlim = c(0, 1),
  ylim = c(0, 1),
  col = 1,
  lty = NULL,
  lwd = NA,
  main = "",
  curve_options = list(col = 2, lwd = 2, lty = 1),
  par_plot = lifecycle::deprecated(),
  legend_options = lifecycle::deprecated(),
  ...
)
```

Arguments

x	an object of class initValOW, generated with [TTT_hazard_shape](#).
xlab, ylab	titles for x and y axes, as in [plot](#).
xlim	the x limits (x1, x2) of the plot.
ylim	the y limits (x1, x2) of the plot.
col	the colors for lines and points. Multiple colors can be specified. This is the usual color argument of [plot.default](#).
lty	a vector of line types, see [par](#) for further information.
lwd	a vector of line widths, see [par](#) for further information.
main	a main title for the plot.
curve_options	a list with further arguments useful for customization of non-parametric estimate plot.

par_plot	(deprecated) some graphical parameters which can be passed to the plot. See **Details** section for further information.
legend_options	(deprecated) a list with fur further arguments useful for customization. See **Details** section for further information. of the legend of the plot.
...	further arguments passed to empirical TTT plot.

Details

This plot complements the use of TTT_hazard_shape. It is always advisable to use this function in order to check the result of non-parametric estimate of TTT plot. See the first example in **Examples** section for an illustration.

plot(my_initial_guess)

#-------------------------------------------------------------------------------
```

| predict.maxlogL | *Predict Method for* maxlogL *Fits* |

Description

[Maturing]

This function computes predictions and optionally the estimated standard errors of those predictions from a model fitted with maxlogLreg.

Usage

```
## S3 method for class 'maxlogL'
predict(
  object,
  parameter = NULL,
  newdata = NULL,
  type = c("link", "response", "terms"),
  se.fit = FALSE,
  terms = NULL,
  ...
)
```

Arguments

`object`	an object of `maxlogL` class generated by [maxlogLreg](#) function.
`parameter`	a character which specifies the parameter to predict.
`newdata`	a data frame with covariates with which to predict. It is an optional argument, if omitted, the fitted linear predictors or the (distribution) parameter predictions are used.
`type`	a character with the type of prediction required. The default (`type = "link"`) is on the scale of the linear predictors; the alternative `type = "response"` is on the scale of the distribution parameter.
`se.fit`	logical switch indicating if standard errors of predictions are required.
`terms`	A character vector that specifies which terms are required if `type = "terms"`. All terms are returned by default.
`...`	further arguments passed to or from other methods.

Details

This `predict` method computes predictions for values of any distribution parameter in link or original scale.

Value

If `se.fit = FALSE`, a vector of predictions is returned. For `type = "terms"`, a matrix with a column per term and an attribute "constant" is returned.

If `se.fit = TRUE`, a list with the following components is obtained:

1. `fit`: Predictions.
2. `se.fit`: Estimated standard errors.

Note

Variables are first looked for in `newdata` argument and then searched in the usual way (which will include the environment of the formula used in the fit). A warning will be given if the variables found are not of the same length as those in `newdata` if it is supplied.

Jaime Mosquera Gutiérrez, <jmosquerag@unal.edu.co>

Examples

```
library(EstimationTools)

#----------------------------------------------------------------------------
# Example 1: Predictions from a model using a simulated normal distribution
n <- 1000
x <- runif(n = n, -5, 6)
y <- rnorm(n = n, mean = -2 + 3 * x, sd = exp(1 + 0.3* x))
norm_data <- data.frame(y = y, x = x)

# It does not matter the order of distribution parameters
formulas <- list(sd.fo = ~ x, mean.fo = ~ x)

norm_mod <- maxlogLreg(formulas, y_dist = y ~ dnorm, data = norm_data,
                       link = list(over = "sd", fun = "log_link"))
predict(norm_mod)

#----------------------------------------------------------------------------
# Example 2: Predictions using new values for covariates
predict(norm_mod, newdata = data.frame(x=0:6))

#----------------------------------------------------------------------------
# Example 3: Predictions for another parameter
predict(norm_mod, newdata = data.frame(x=0:6), param = "sd",
        type = "response")

#----------------------------------------------------------------------------
# Example 4: Model terms
predict(norm_mod, param = "sd", type = "terms")

#----------------------------------------------------------------------------
```

---

print.HazardShape   *Print method for* HazardShape *objects*

Description

[Experimental]

Displays the estimated hazard shape given a HazardShape object.

Usage

```
## S3 method for class 'HazardShape'
print(x, ...)
```

Arguments

x   an object of class HazardShape, generated with TTT_hazard_shape.

...   further arguments passed to or from other methods.

Author(s)

Jaime Mosquera Gutiérrez <jmosquerag@unal.edu.co>

Examples

```
#-------------------------------------------------------------------------------
# Example 1: Increasing hazard and its corresponding TTT plot with simulated data

hweibull <- function(x, shape, scale){
  dweibull(x, shape, scale)/pweibull(x, shape, scale, lower.tail = FALSE)
  }
curve(hweibull(x, shape = 2.5, scale = pi), from = 0, to = 42,
               col = "red", ylab = "Hazard function", las = 1, lwd = 2)

y <- rweibull(n = 50, shape = 2.5, scale = pi)
my_initial_guess <- TTT_hazard_shape(formula = y ~ 1)

reduction_cells   *Reduction cells*

Description

Times to failure (in units of 1000 days) of 20 aluminum reduction cells.

Usage

```
reduction_cells
```

Format

A data frame with 20 observations.

References

Whitmore GA (1983). "A regression method for censored inverse-Gaussian data." *Canadian Journal of Statistics*, **11**(4), 305–315. ISSN 03195724, doi:10.2307/3314888.

Examples

```
data(reduction_cells)
par(mfrow = c(1,2))
hist(reduction_cells$days, main="", xlab="Time (Days)")
plot(reduction_cells$status, xlab = "Status", lty = 3, type="h")
points(reduction_cells$status, pch = 16)
```

---

residuals.maxlogL   *Extract Residuals from* maxlogL *model.*

Description

[Experimental]

residuals.,axlogL is the maxlogLreg specific method for the generic function residuals which extracts the residuals from a fitted model.

Usage

```
## S3 method for class 'maxlogL'
residuals(object, parameter = NULL, type = c("deviance", "response"), ...)
```

Arguments

object	an object of maxlogL class which summary is desired.
parameter	a character which specifies the parameter whose normalized quantile residuals will be computed.
type	a character with the type of residuals to be computed required. The default value is type = "rqres", which is used to compute the normalized randomized quantile residuals.
...	for extra arguments.

Details

For type = "deviance", the residuals are computed using the following expression

$$r_i^D = \text{sign}(y_i - \hat{\mu}_i)d_i^{1/2},$$

where d_i is the residual deviance of each data point. In this context, $\hat{\mu}$ is the estimated mean, computed as the expected value using the estimated parameters of a fitted maxlogLreg model.

On the other hand, for type = "response" the computation is simpler

$$r_i^R = (y_i - \hat{\mu}_i).$$

summary.maxlogL   *Summarize Maximum Likelihood Estimation*

Description

[Maturing]

Displays maximum likelihood estimates computed with maxlogL with its standard errors, AIC and BIC. This is a summary method for maxlogL object.

Usage

```
## S3 method for class 'maxlogL'
summary(object, ...)
```

Arguments

object   an object of maxlogL class which summary is desired.

...   additional arguments affecting the summary produced.

Details

This summary method computes and displays AIC, BIC, estimates and standard errors from a estimated model stored i a maxlogL class object. It also displays and computes Z-score and p values of significance test of parameters.

Value

A list with information that summarize results of a maxlogL class object.

Author(s)

Jaime Mosquera Gutiérrez, <jmosquerag@unal.edu.co>

#-------------------------------------------------------------------------------
# Third example: Binomial probability parameter estimation with no variable
# creation

N <- rbinom(n = 100, size = 10, prob = 0.3)
summary(maxlogL(x = N, dist = 'dbinom', fixed = list(size = 10),
                link = list(over = "prob", fun = "logit_link")))

#-------------------------------------------------------------------------------
# Fourth example: Estimation in a regression model with simulated normal data
n <- 1000
x <- runif(n = n, -5, 6)
y <- rnorm(n = n, mean = -2 + 3 * x, sd = exp(1 + 0.3* x))
norm_data <- data.frame(y = y, x = x)
formulas <- list(sd.fo = ~ x, mean.fo = ~ x)

norm_mod <- maxlogLreg(formulas, y_dist = y ~ dnorm, data = norm_data,
                       link = list(over = "sd", fun = "log_link"))

## 'summary' method
summary(norm_mod)

#-------------------------------------------------------------------------------
```

Description

[Experimental]

Discrete summation of functions of one variable over a finite or semi-infinite interval.

Usage

```
summate(fun, lower, upper, tol = 1e-10, ...)
```

Arguments

fun	an **R** function which should take a numeric argument x and possibly some parameters. The function returns a numerical vector value for the given argument x.
lower	a numeric value for the lower limit of the integral.
upper	a numeric value for the upper limit of the integral.
tol	a numeric value indicating the accuracy of the result (useful in infinite summations).
...	additional arguments to be passed to fun.

Details

Arguments after ... must be matched exactly. If both limits are infinite, the function fails. For semi-infinite intervals, the summation must be convergent. This is accomplished in manny probability mass functions.

Author(s)

Jaime Mosquera Gutiérrez, <jmosquerag@unal.edu.co>

Examples

```
library(EstimationTools)

#-----------------------------------------------------------------------------
# Example 1: Poisson expected value computation, X ~ Poisson(lambda = 15)
Poisson_integrand <- function(x, lambda) {
  x * lambda^x * exp(-lambda)/factorial(x)
}

summate(fun = Poisson_integrand, lower = 0, upper = Inf, lambda = 15)
```

```
#-------------------------------------------------------------------------
```

TTTE_Analytical *Empirical Total Time on Test (TTT), analytic version.*

Description

[Experimental]

This function allows to compute the TTT curve from a formula containing a factor type variable (classification variable).

Usage

```
TTTE_Analytical(
  formula,
  response = NULL,
  scaled = TRUE,
  data = NULL,
  method = c("Barlow", "censored"),
  partition_method = NULL,
  silent = FALSE,
  ...
)
```

Arguments

formula   an object of class [formula](#) with the response on the left of an operator ~. The
                  right side can be a factor variable as term or an 1 if a classification by factor
                  levels is not desired.

response   an optional numeric vector with data of the response variable. Using this argu-
                  ment is equivalent to define a formula with the right side such as ~ 1. See the
                  fourth example below.

scaled   logical. If TRUE (default value), scaled TTT is computed.

data   an optional data frame containing the variables (response and the factor, if it is
                  desired). If data is not specified, the variables are taken from the environment
                  from which TTT_analytical is called.

method   a character specifying the method of computation. There are two options avail-
                  able: 'Barlow' and 'censored'. Further information can be found in the **De-
                  tails** section.

partition_method

                  a list specifying cluster formation when the covariate in formula is numeric, or
                  when the data has several covariates. 'quantile-based' method is the only one
                  currently available (See the last example).

silent   logical. If TRUE, warnings of TTTE_Analytical are suppressed.

...   further arguments passing to [survfit](#).

Details

When `method` argument is set as `'Barlow'`, this function uses the original expression of empirical TTT presented by Barlow (1979) and used by Aarset (1987):

$$\phi_n \left(\frac{r}{n} \right) = \frac{\left(\sum_{i=1}^{r} T_{(i)} \right) + (n-r) T_{(r)}}{\sum_{i=1}^{n} T_i}$$

where $T_{(r)}$ is the rth order statistic, with $r = 1, 2, \ldots, n$, and n is the sample size. On the other hand, the option *'censored'* is an implementation based on integrals presented in Westberg and Klefsjö (1994), and using `survfit` to compute the Kaplan-Meier estimator:

$$\phi_n \left(\frac{r}{n} \right) = \sum_{j=1}^{r} \left[\prod_{i=1}^{j} \left(1 - \frac{d_i}{n_i} \right) \right] \left(T_{(j)} - T_{(j-1)} \right)$$

Value

A list with class object `Empirical.TTT` containing a list with the following information:

`i/n'`	A matrix containing the empirical quantiles. This matrix has the number of columns equals to the number of levels of the factor considered (number of strata).
`phi_n`	A matrix containing the values of empirical TTT. his matrix has the number of columns equals to the number of levels of the factor considered (number of strata).
`strata`	A numeric named vector storing the number of observations per strata, and the name of each strata (names of the levels of the factor).

TTT_hazard_shape   *Hazard Shape estimation from TTT plot*

Description

[Experimental]

This function can be used so as to estimate hazard shape corresponding to a given data set. This is
a wrapper for [TTTE_Analytical](#).

Usage

```
TTT_hazard_shape(object, ...)

## S3 method for class 'formula'
TTT_hazard_shape(
  formula,
  data = NULL,
  local_reg = loess.options(),
  interpolation = interp.options(),
  silent = FALSE,
  ...
)

## S3 method for class 'EmpiricalTTT'
TTT_hazard_shape(
  object,
  local_reg = loess.options(),
  interpolation = interp.options(),
  silent = FALSE,
  ...
)
```

Arguments

`object`	An alternative way for getting the hazard shape estimation in passing directly the EmpiricalTTT object generated with [`TTTE_Analytical`](#).
`...`	further arguments passed to [`TTTE_Analytical`](#).
`formula`	An object of class [`formula`](#) with the response on the left of an operator ~. The right side must be 1.
`data`	an optional data frame containing the response variables. If data is not specified, the variables are taken from the environment from which [`TTT_hazard_shape`](#) is called.
`local_reg`	a list of control parameters for LOESS. See [`loess.options`](#).
`interpolation`	a list of control parameters for interpolation function. See [`interp.options`](#).
`silent`	logical. If TRUE, warnings of TTT_hazard_shape are suppressed.

Details

This function performs a non-parametric estimation of the empirical total time on test (TTT) plot. Then, this estimated curve can be used so as to get suggestions about initial values and the search region for parameters based on hazard shape associated to the shape of empirical TTT plot.

Use [`Hazard_Shape`](#) function to get the results for shape estimation.

uniform_key   *Uniform key function*

Description

[Experimental]

This function provides the uniform key function for model fitting in distance sampling.

Usage

```
uniform_key(x, w)
```

Arguments

x	vector of perpendicular distances from the transect.
w	half width of the strip transect.

Details

This is the uniform key function with parameter sigma. Its expression is given by

$$g(x) = \frac{1}{w},$$

for x > 0.

Value

A numeric value corresponding to a given value of x and w.
