

# Package ‘LikertEZ’

March 31, 2025

**Title** Easy Analysis and Visualization of Likert Scale Data

**Version** 0.1.0

**Description** Provides functions for summarizing, visualizing, and analyzing Likert-scale survey data. Includes support for computing descriptive statistics, Relative Importance Index (RII), reliability analysis (Cronbach's Alpha), and response distribution plots.

**License** MIT + file LICENSE

**Encoding** UTF-8

**RoxygenNote** 7.3.2

**Imports** ggplot2, stats, utils

**NeedsCompilation** no

**Author** Mohammad Mollazehi [aut, cre]

**Maintainer** Mohammad Mollazehi <mmolazehi@lu.edu.qa>

**Repository** CRAN

**Date/Publication** 2025-03-31 17:30:13 UTC

`cronbach_alpha`      *Cronbach Alpha for a set of ordinal items*

### Description

This function calculates the Cronbach Alpha for a set of ordinal items to assess their reliability or internal consistency.

### Usage

```
cronbach_alpha(data)
```

### Arguments

`data`      A data.frame with the ordinal items. Each column represents an item.

### Value

The Cronbach alpha value as a numeric value between 0 and 1.

`plot_item`      *Barplot with RII annotation*

### Description

This function generates a barplot showing the distribution of responses for a single item, with the Relative Importance Index (RII) annotated.

### Usage

```
plot_item(responses, max_scale = 5, scale_labels = NULL)
```

### Arguments

<code>responses</code>	Numeric vector of ordinal responses.
<code>max_scale</code>	Max Likert scale value (default: 5).
<code>scale_labels</code>	Optional vector of labels for each scale point.

### Value

A ggplot2 bar plot with RII annotation.

### Examples

```
responses <- c(1, 2, 3, 4, 5, 3, 2, 1, NA)
plot_item(responses)
```

---

rank_items	<i>Rank items by RII or Mean</i>
------------	----------------------------------

---

## Description

This function ranks items in the data based on either the Relative Importance Index (RII) or the mean of responses.

## Usage

```
rank_items(data, method = "rii", max_scale = 5, n = 5, top = TRUE)
```

## Arguments

data	A data.frame of ordinal items.
method	Method to rank items. Either "rii" (for Relative Importance Index) or "mean" (for mean response).
max_scale	Max Likert scale value (default: 5).
n	Number of top items to return (default: 5).
top	Logical. If TRUE, returns the top items, otherwise returns the bottom items (default: TRUE).

## Value

A vector of ranked items.

---

rii_weighted	<i>Weighted RII Calculation</i>
--------------	---------------------------------

---

## Description

This function computes the weighted Relative Importance Index (RII) for a set of ordinal responses with associated weights.

## Usage

```
rii_weighted(responses, weights, max_scale = 5)
```

## Arguments

responses	Numeric vector of ordinal responses.
weights	Numeric vector of weights for each response.
max_scale	Max Likert scale value (default: 5).

## Value

The weighted RII as a numeric value.

summarize	<i>Summarize a Likert item</i>
-----------	--------------------------------

## Description

This function calculates summary statistics for a Likert item, including mean, median, mode, and performs a chi-square test.

## Usage

```
summarize(responses, max_scale = 5, exact = TRUE, B = 10000, tidy = FALSE)
```

## Arguments

<code>responses</code>	Numeric vector of responses.
<code>max_scale</code>	The maximum scale value.
<code>exact</code>	If TRUE, use exact Monte Carlo method.
<code>B</code>	Number of simulations for Monte Carlo.
<code>tidy</code>	If TRUE, returns a tidy data frame.

## Value

A list or data.frame with summary statistics.

## Examples

```
responses <- c(1, 2, 3, 4, 5, 4, 3, 2, NA)
summarize(responses)
```

summary_table_all	<i>Create a tidy summary table of all items</i>
-------------------	---

## Description

This function generates a tidy summary table for all ordinal items in a data.frame. The table includes statistics such as mean, median, standard deviation, counts, and percentages.

## Usage

```
summary_table_all(data, max_scale = 5, scale_labels = NULL, decimals = 2)
```

**Arguments**

data	A data.frame of ordinal items.
max_scale	Max value on the Likert scale (default: 5).
scale_labels	Optional vector of labels for each scale point.
decimals	Number of decimal places for percentages (default: 2).

**Value**

A data.frame with summary statistics for all items.

**Examples**

```
dat <- data.frame(Q1 = c(1, 2, 3, 4, 5), Q2 = c(2, 2, 3, 4, NA))
summary_table_all(dat)
```
