

Package ‘HIMA’

January 27, 2025

Type Package

Title High-Dimensional Mediation Analysis

Version 2.3.1

Date 2025-01-27

Description Allows to estimate and test high-dimensional mediation effects based on advanced mediator screening and penalized regression techniques. Methods used in the package refer to Zhang H, Zheng Y, Zhang Z, Gao T, Joyce B, Yoon G, Zhang W, Schwartz J, Just A, Colicino E, Vokonas P, Zhao L, Lv J, Baccarelli A, Hou L, Liu L. HIMA-package

High-Dimensional Mediation Analysis for 'Omic' Data

Description

HIMA is an R package for estimating and testing high-dimensional mediation effects in omic studies. HIMA can perform high-dimensional mediation analysis on a wide range of omic data types as potential mediators, including epigenetics, transcriptomics, proteomics, metabolomics, and microbiomics. HIMA can also handle survival data mediation analysis and perform quantile mediation analysis.

Package: HIMA
 Type: Package
 Version: 2.3.0
 Date: 2025-01-27
 License: GPL-3

BinaryOutcome

Binary Outcome Dataset for HIMA Demo

Description

A dataset containing phenotype data and high-dimensional mediators for binary outcome analysis. The dataset was simulated using parameters generated from real data.

Usage

BinaryOutcome

Format

A list with the following components:

PhenoData A data frame containing:

Treatment treated (value = 1) or not treated (value = 0).

Disease binary outcome: diseased (value = 1) or healthy (value = 0).

Sex female (value = 1) or male (value = 0).

Age age of the participant.

Mediator A matrix of high-dimensional mediators (rows: samples, columns: variables).

Examples

```
data(BinaryOutcome)
head(BinaryOutcome$PhenoData)
```

ContinuousOutcome *Continuous Outcome Dataset for HIMA Demo*

Description

A dataset containing phenotype data and high-dimensional mediators for continuous outcome analysis. The dataset was simulated using parameters generated from real data.

Usage

```
ContinuousOutcome
```

Format

A list with the following components:

PhenoData A data frame containing:

Treatment treated (value = 1) or not treated (value = 0).

Outcome a normally distributed continuous outcome variable.

Sex female (value = 1) or male (value = 0).

Age age of the participant.

Mediator A matrix of high-dimensional mediators (rows: samples, columns: variables).

Examples

```
data(ContinuousOutcome)
head(ContinuousOutcome$PhenoData)
```

Description

hima is a wrapper function designed to perform various HIMA methods for estimating and testing high-dimensional mediation effects. hima can automatically select the appropriate HIMA method based on the outcome and mediator data type.

Usage

```
hima(
  formula,
  data.pheno,
  data.M,
  mediator.type = c("gaussian", "negbin", "compositional"),
  penalty = c("Dblasso", "MCP", "SCAD", "lasso"),
  quantile = FALSE,
  efficient = FALSE,
  scale = TRUE,
  sigcut = 0.05,
  contrast = NULL,
  subset = NULL,
  verbose = FALSE,
  ...
)
```

Arguments

formula	an object of class formula representing the overall effect model to be fitted, specified as <code>outcome ~ exposure + covariates</code> . The "exposure" variable (the variable of interest) must be listed first on the right-hand side of the formula.
data.pheno	a data frame containing the exposure, outcome, and covariates specified in the formula. Variable names in <code>data.pheno</code> must match those in the formula. When <code>scale = TRUE</code> , the exposure and covariates will be scaled (the outcome retains its original scale).
data.M	a <code>data.frame</code> or <code>matrix</code> of high-dimensional mediators, with rows representing samples and columns representing mediator variables. When <code>scale = TRUE</code> , <code>data.M</code> will be scaled.
mediator.type	a character string indicating the data type of the high-dimensional mediators (<code>data.M</code>). Options are: 'gaussian' (default): for continuous mediators. 'negbin': for count data mediators modeled using the negative binomial distribution (e.g., RNA-seq data). 'compositional': for compositional data mediators (e.g., microbiome data).

penalty	a character string specifying the penalty method to apply in the model. Options are: 'DBlasso': De-biased LASSO (default). 'MCP': Minimax Concave Penalty. 'SCAD': Smoothly Clipped Absolute Deviation. 'lasso': Least Absolute Shrinkage and Selection Operator. Note: Survival HIMA and microbiome HIMA can only be performed with 'DBlasso'. Quantile HIMA and efficient HIMA cannot use 'DBlasso'; they always apply 'MCP'.
quantile	logical. Indicates whether to use quantile HIMA (<code>hima_quantile</code>). Default is FALSE. Applicable only for classic HIMA with a continuous outcome and <code>mediator.type = 'gaussian'</code> . If TRUE, specify the desired quantile(s) using the <code>tau</code> parameter; otherwise, the default <code>tau = 0.5</code> (i.e., median) is used.
efficient	logical. Indicates whether to use efficient HIMA (<code>hima_efficient</code>). Default is FALSE. Applicable only for classic HIMA with a continuous outcome and <code>mediator.type = 'gaussian'</code> .
scale	logical. Determines whether the function scales the data (exposure, mediators, and covariates). Default is TRUE. Note: For simulation studies, set <code>scale = FALSE</code> to avoid estimate compression (i.e., shrinkage of estimates toward zero due to scaling).
sigcut	numeric. The significance cutoff for selecting mediators. Default is 0.05.
contrast	a named list of contrasts to be applied to factor variables in the covariates (cannot be the variable of interest).
subset	an optional vector specifying a subset of observations to use in the analysis.
verbose	logical. Determines whether the function displays progress messages. Default is FALSE.
...	reserved passing parameter (or for future use).

Value

A data.frame containing mediation testing results of selected mediators.

ID: Mediator ID/name.

alpha: Coefficient estimates of exposure (X) → mediators (M) (adjusted for covariates).

beta: Coefficient estimates of mediators (M) → outcome (Y) (adjusted for covariates and exposure).

alpha*beta: The estimated indirect (mediation) effect of exposure on outcome through each mediator.

Relative Importance: The proportion of each mediator's mediation effect relative to the sum of the absolute mediation effects of all significant mediators.

p-value: The joint p-value assessing the significance of each mediator's indirect effect, calculated based on the corresponding statistical approach.

tau: The quantile level of the outcome (applicable only when using the quantile mediation model).

Examples

```
## Not run:
# Note: In the following examples, M1, M2, and M3 are true mediators.

# Example 1 (continuous outcome - linear HIMA):
head(ContinuousOutcome$PhenoData)

e1 <- hima(Outcome ~ Treatment + Sex + Age,
  data.pheno = ContinuousOutcome$PhenoData,
  data.M = ContinuousOutcome$Mediator,
  mediator.type = "gaussian",
  penalty = "MCP", # Can be "DBlasso" for hima_dblasso
  scale = FALSE
) # Disabled only for simulation data
summary(e1)

# Efficient HIMA (only applicable to mediators and outcomes that are
# both continuous and normally distributed.)
e1e <- hima(Outcome ~ Treatment + Sex + Age,
  data.pheno = ContinuousOutcome$PhenoData,
  data.M = ContinuousOutcome$Mediator,
  mediator.type = "gaussian",
  efficient = TRUE,
```

```

    penalty = "MCP", # Efficient HIMA does not support DBlasso
    scale = FALSE
  ) # Disabled only for simulation data
summary(e1e)

# Example 2 (binary outcome - logistic HIMA):
head(BinaryOutcome$PhenoData)

e2 <- hima(Disease ~ Treatment + Sex + Age,
  data.pheno = BinaryOutcome$PhenoData,
  data.M = BinaryOutcome$Mediator,
  mediator.type = "gaussian",
  penalty = "MCP",
  scale = FALSE
) # Disabled only for simulation data
summary(e2)

# Example 3 (time-to-event outcome - survival HIMA):
head(SurvivalData$PhenoData)

e3 <- hima(Surv(Time, Status) ~ Treatment + Sex + Age,
  data.pheno = SurvivalData$PhenoData,
  data.M = SurvivalData$Mediator,
  mediator.type = "gaussian",
  penalty = "DBlasso",
  scale = FALSE
) # Disabled only for simulation data
summary(e3)

# Example 4 (compositional data as mediator, e.g., microbiome):
head(MicrobiomeData$PhenoData)

e4 <- hima(Outcome ~ Treatment + Sex + Age,
  data.pheno = MicrobiomeData$PhenoData,
  data.M = MicrobiomeData$Mediator,
  mediator.type = "compositional",
  penalty = "DBlasso"
) # Scaling is always enabled internally for hima_microbiome
summary(e4)

#' # Example 5 (quantile mediation analysis - quantile HIMA):
head(QuantileData$PhenoData)

# Note that the function will prompt input for quantile level.
e5 <- hima(Outcome ~ Treatment + Sex + Age,
  data.pheno = QuantileData$PhenoData,
  data.M = QuantileData$Mediator,
  mediator.type = "gaussian",
  quantile = TRUE,
  penalty = "MCP", # Quantile HIMA does not support DBlasso
  scale = FALSE, # Disabled only for simulation data
  tau = c(0.3, 0.5, 0.7)
) # Specify multiple quantile level

```

```
summary(e5)

## End(Not run)
```

hima_classic

Classic high-dimensional mediation analysis

Description

hima_classic is used to estimate and test classic high-dimensional mediation effects (linear & logistic regression).

Usage

```
hima_classic(
  X,
  M,
  Y,
  COV.XM = NULL,
  COV.MY = COV.XM,
  Y.type = c("continuous", "binary"),
  M.type = c("gaussian", "negbin"),
  penalty = c("MCP", "SCAD", "lasso"),
  topN = NULL,
  parallel = FALSE,
  ncore = 1,
  scale = TRUE,
  Bonfcut = 0.05,
  verbose = FALSE,
  ...
)
```

Arguments

X	a vector of exposure. Do not use data.frame or matrix.
M	a data.frame or matrix of high-dimensional mediators. Rows represent samples, columns represent variables.
Y	a vector of outcome. Can be either continuous or binary (0-1). Do not use data.frame or matrix.
COV.XM	a data.frame or matrix of covariates dataset for testing the association $M \sim X$. Covariates specified here will not participate penalization. Default = NULL. If the covariates contain mixed data types, please make sure all categorical variables are properly formatted as factor type.

COV.MY	a data.frame or matrix of covariates dataset for testing the association $Y \sim M$. Covariates specified here will not participate penalization. If not specified, the same set of covariates for $M \sim X$ will be applied (i.e., COV.XM. Using different sets of covariates is allowed but this needs to be handled carefully).
Y.type	data type of outcome (Y). Either 'continuous' (default) or 'binary'.
M.type	data type of mediator (M). Either 'gaussian' (default) or 'negbin' (i.e., negative binomial).
penalty	the penalty to be applied to the model. Either 'MCP' (the default), 'SCAD', or 'lasso'.
topN	an integer specifying the number of top markers from sure independent screening. Default = NULL. If NULL, topN will be either $\text{ceiling}(n/\log(n))$ for continuous outcome, or $\text{ceiling}(n/(2*\log(n)))$ for binary outcome, where n is the sample size. If the sample size is greater than topN (pre-specified or calculated), all mediators will be included in the test (i.e. low-dimensional scenario).
parallel	logical. Enable parallel computing feature? Default = FALSE.
ncore	number of cores to run parallel computing Valid when parallel = TRUE. By default max number of cores available in the machine will be utilized.
scale	logical. Should the function scale the data? Default = TRUE.
Bonfcut	Bonferroni-corrected p value cutoff applied to select significant mediators. Default = 0.05.
verbose	logical. Should the function be verbose? Default = FALSE.
...	other arguments passed to ncvreg.

Value

A data.frame containing mediation testing results of selected mediators.

Index: mediation name of selected significant mediator.

alpha_hat: coefficient estimates of exposure (X) \rightarrow mediators (M) (adjusted for covariates).

beta_hat: coefficient estimates of mediators (M) \rightarrow outcome (Y) (adjusted for covariates and exposure).

IDE: mediation (indirect) effect, i.e., $\alpha*\beta$.

rimp: relative importance of the mediator.

pmax: joint raw p-value of selected significant mediator (based on Bonferroni method).

Examples

```

## Not run:
# Note: In the following examples, M1, M2, and M3 are true mediators.

# When Y is continuous and normally distributed
# Example 1 (continuous outcome):
head(ContinuousOutcome$PhenoData)

hima.fit <- hima_classic(
  X = ContinuousOutcome$PhenoData$Treatment,
  Y = ContinuousOutcome$PhenoData$Outcome,
  M = ContinuousOutcome$Mediator,
  COV.XM = ContinuousOutcome$PhenoData[, c("Sex", "Age")],
  Y.type = "continuous",
  scale = FALSE, # Disabled only for simulation data
  verbose = TRUE
)
hima.fit

# When Y is binary
# Example 2 (binary outcome):
head(BinaryOutcome$PhenoData)

hima.logistic.fit <- hima_classic(
  X = BinaryOutcome$PhenoData$Treatment,
  Y = BinaryOutcome$PhenoData$Disease,
  M = BinaryOutcome$Mediator,
  COV.XM = BinaryOutcome$PhenoData[, c("Sex", "Age")],
  Y.type = "binary",
  scale = FALSE, # Disabled only for simulation data
  verbose = TRUE
)
hima.logistic.fit

## End(Not run)

```

hima_dblasso

High-dimensional mediation analysis with de-biased lasso penalty

Description

hima_dblasso is used to estimate and test high-dimensional mediation effects using de-biased lasso penalty.

Usage

```

hima_dblasso(
  X,

```

```

M,
Y,
COV = NULL,
topN = NULL,
scale = TRUE,
FDRcut = 0.05,
verbose = FALSE
)

```

Arguments

X	a vector of exposure. Do not use <code>data.frame</code> or <code>matrix</code> .
M	a <code>data.frame</code> or <code>matrix</code> of high-dimensional mediators. Rows represent samples, columns represent variables.
Y	a vector of outcome. Can be either continuous or binary (0-1). Do not use <code>data.frame</code> or <code>matrix</code> .
COV	a <code>data.frame</code> or <code>matrix</code> of covariates dataset for testing the association $M \sim X$ and $Y \sim M$.
topN	an integer specifying the number of top markers from sure independent screening. Default = NULL. If NULL, topN will be $\text{ceiling}(n/\log(n))$, where n is the sample size. If the sample size is greater than topN (pre-specified or calculated), all mediators will be included in the test (i.e. low-dimensional scenario).
scale	logical. Should the function scale the data? Default = TRUE.
FDRcut	HDMT pointwise FDR cutoff applied to select significant mediators. Default = 0.05.
verbose	logical. Should the function be verbose? Default = FALSE.

Value

A `data.frame` containing mediation testing results of significant mediators ($\text{FDR} < \text{FDRcut}$).

Index: mediation name of selected significant mediator.

alpha_hat: coefficient estimates of exposure (X) \rightarrow mediators (M) (adjusted for covariates).

alpha_se: standard error for alpha.

beta_hat: coefficient estimates of mediators (M) \rightarrow outcome (Y) (adjusted for covariates and exposure).

beta_se: standard error for beta.

IDE: mediation (indirect) effect, i.e., $\text{alpha} \cdot \text{beta}$.

rimp: relative importance of the mediator.

pmax: joint raw p-value of selected significant mediator (based on HDMT pointwise FDR method).

Examples

```
## Not run:
# Note: In the following examples, M1, M2, and M3 are true mediators.

# Y is continuous and normally distributed
# Example:
head(ContinuousOutcome$PhenoData)

hima_dblasso.fit <- hima_dblasso(
  X = ContinuousOutcome$PhenoData$Treatment,
  Y = ContinuousOutcome$PhenoData$Outcome,
  M = ContinuousOutcome$Mediator,
  COV = ContinuousOutcome$PhenoData[, c("Sex", "Age")],
  scale = FALSE, # Disabled only for simulation data
  FDRcut = 0.05,
  verbose = TRUE
)
hima_dblasso.fit

## End(Not run)
```

hima_efficient

Efficient high-dimensional mediation analysis

Description

hima_efficient is used to estimate and test high-dimensional mediation effects using an efficient algorithm. It provides higher statistical power than the standard hima. Note: efficient HIMA is only applicable to mediators and outcomes that are both continuous and normally distributed.

Usage

```
hima_efficient(
  X,
  M,
  Y,
  COV = NULL,
  topN = NULL,
  scale = TRUE,
  FDRcut = 0.05,
  verbose = FALSE
)
```

Arguments

X a vector of exposure. Do not use data.frame or matrix.

M	a data.frame or matrix of high-dimensional mediators. Rows represent samples, columns represent mediator variables. M has to be continuous and normally distributed.
Y	a vector of continuous outcome. Do not use data.frame or matrix.
COV	a matrix of adjusting covariates. Rows represent samples, columns represent variables. Can be NULL.
topN	an integer specifying the number of top markers from sure independent screening. Default = NULL. If NULL, topN will be $2 \times \text{ceiling}(n/\log(n))$, where n is the sample size. If the sample size is greater than topN (pre-specified or calculated), all mediators will be included in the test (i.e. low-dimensional scenario).
scale	logical. Should the function scale the data? Default = TRUE.
FDRcut	Benjamini-Hochberg FDR cutoff applied to select significant mediators. Default = 0.05.
verbose	logical. Should the function be verbose? Default = FALSE.

Value

A data.frame containing mediation testing results of significant mediators (FDR < FDRcut).

Index: mediation name of selected significant mediator.

alpha_hat: coefficient estimates of exposure (X) → mediators (M) (adjusted for covariates).

alpha_se: standard error for alpha.

beta_hat: coefficient estimates of mediators (M) → outcome (Y) (adjusted for covariates and exposure).

beta_se: standard error for beta.

IDE: mediation (indirect) effect, i.e., $\alpha \times \beta$.

rimp: relative importance of the mediator.

pmax: joint raw p-value of selected significant mediator (based on divide-aggregate composite-null test [DACT] method).

Examples

```
## Not run:
# Note: In the following example, M1, M2, and M3 are true mediators.

# Y is continuous and normally distributed
# Example (continuous outcome):
head(ContinuousOutcome$PhenoData)

hima_efficient.fit <- hima_efficient(
```

```

X = ContinuousOutcome$PhenoData$Treatment,
Y = ContinuousOutcome$PhenoData$Outcome,
M = ContinuousOutcome$Mediator,
COV = ContinuousOutcome$PhenoData[, c("Sex", "Age")],
scale = FALSE, # Disabled only for simulation data
FDRcut = 0.05,
verbose = TRUE
)
hima_efficient.fit

## End(Not run)

```

hima_microbiome	<i>High-dimensional mediation analysis for compositional microbiome data</i>
-----------------	--

Description

hima_microbiome is used to estimate and test high-dimensional mediation effects for compositional microbiome data.

Usage

```
hima_microbiome(X, OTU, Y, COV = NULL, FDRcut = 0.05, verbose = FALSE)
```

Arguments

X	a vector of exposure. Do not use data.frame or matrix.
OTU	a data.frame or matrix of high-dimensional Operational Taxonomic Unit (OTU) data (mediators). Rows represent samples, columns represent variables.
Y	a vector of continuous outcome. Binary outcome is not allowed. Do not use data.frame or matrix.
COV	a data.frame or matrix of adjusting covariates. Rows represent samples, columns represent microbiome variables. Can be NULL.
FDRcut	Hommel FDR cutoff applied to select significant mediators. Default = 0.05.
verbose	logical. Should the function be verbose? Default = FALSE.

Value

A data.frame containing mediation testing results of significant mediators (FDR < FDRcut).

Index: mediation name of selected significant mediator.

alpha_hat: coefficient estimates of exposure (X) → mediators (M) (adjusted for covariates).

alpha_se: standard error for alpha.

beta_hat: coefficient estimates of mediators (M) → outcome (Y) (adjusted for covariates and exposure).

beta_se: standard error for beta.

IDE: mediation (indirect) effect, i.e., $\alpha \cdot \beta$.

rimp: relative importance of the mediator.

pmax: joint raw p-value of selected significant mediator (based on Hommel FDR method).

hima_quantile

High-dimensional quantile mediation analysis

Description

hima_quantile is used to estimate and test high-dimensional quantile mediation effects.

Usage

```
hima_quantile(
  X,
  M,
  Y,
```

```

COV = NULL,
penalty = c("MCP", "SCAD", "lasso"),
topN = NULL,
tau = 0.5,
scale = TRUE,
Bonfcut = 0.05,
verbose = FALSE,
...
)

```

Arguments

X	a vector of exposure. Do not use data.frame or matrix.
M	a data.frame or matrix of high-dimensional mediators. Rows represent samples, columns represent mediator variables.
Y	a vector of continuous outcome. Do not use data.frame or matrix.
COV	a matrix of adjusting covariates. Rows represent samples, columns represent variables. Can be NULL.
penalty	the penalty to be applied to the model (a parameter passed to function conquer.cv.reg in package conquer. Either 'MCP' (the default), 'SCAD', or 'lasso'.
topN	an integer specifying the number of top markers from sure independent screening. Default = NULL. If NULL, topN will be $2 \times \text{ceiling}(n/\log(n))$, where n is the sample size. If the sample size is greater than topN (pre-specified or calculated), all mediators will be included in the test (i.e. low-dimensional scenario).
tau	quantile level of outcome. Default = 0.5. A vector of tau is accepted.
scale	logical. Should the function scale the data? Default = TRUE.
Bonfcut	Bonferroni-corrected p value cutoff applied to select significant mediators. Default = 0.05.
verbose	logical. Should the function be verbose? Default = FALSE.
...	reserved passing parameter.

Value

A data.frame containing mediation testing results of selected mediators (Bonferroni-adjusted p value < Bonfcut).

Index: mediation name of selected significant mediator.

alpha_hat: coefficient estimates of exposure (X) → mediators (M) (adjusted for covariates).

alpha_se: standard error for alpha.

beta_hat: coefficient estimates of mediators (M) → outcome (Y) (adjusted for covariates and exposure).

beta_se: standard error for beta.

IDE: mediation (indirect) effect, i.e., $\alpha \times \beta$.

rimp: relative importance of the mediator.

pmax: joint raw p-value of selected significant mediator (based on Bonferroni method).

Examples

```
## Not run:
# Note: In the following example, M1, M2, and M3 are true mediators.

head(QuantileData$PhenoData)

hima_quantile.fit <- hima_quantile(
  X = QuantileData$PhenoData$Treatment,
  M = QuantileData$Mediator,
  Y = QuantileData$PhenoData$Outcome,
  COV = QuantileData$PhenoData[, c("Sex", "Age")],
  tau = c(0.3, 0.5, 0.7),
  scale = FALSE, # Disabled only for simulation data
  Bonfcut = 0.05,
  verbose = TRUE
)
hima_quantile.fit

## End(Not run)
```

hima_survival

High-dimensional mediation analysis for survival data

Description

hima_survival is used to estimate and test high-dimensional mediation effects for survival data.

Usage

```
hima_survival(
  X,
  M,
  OT,
  status,
  COV = NULL,
  topN = NULL,
  scale = TRUE,
  FDRcut = 0.05,
  verbose = FALSE
)
```

Arguments

X	a vector of exposure. Do not use <code>data.frame</code> or <code>matrix</code> .
M	a <code>data.frame</code> or <code>matrix</code> of high-dimensional mediators. Rows represent samples, columns represent mediator variables.
OT	a vector of observed failure times.
status	a vector of censoring indicator (<code>status = 1</code> : uncensored; <code>status = 0</code> : censored)
COV	a matrix of adjusting covariates. Rows represent samples, columns represent variables. Can be <code>NULL</code> .
topN	an integer specifying the number of top markers from sure independent screening. Default = <code>NULL</code> . If <code>NULL</code> , <code>topN</code> will be <code>ceiling(n/log(n))</code> , where <code>n</code> is the sample size. If the sample size is greater than <code>topN</code> (pre-specified or calculated), all mediators will be included in the test (i.e. low-dimensional scenario).
scale	logical. Should the function scale the data? Default = <code>TRUE</code> .
FDRcut	HDMT pointwise FDR cutoff applied to select significant mediators. Default = <code>0.05</code> .
verbose	logical. Should the function be verbose? Default = <code>FALSE</code> .

Value

A `data.frame` containing mediation testing results of significant mediators ($FDR < FDRcut$).

Index: mediation name of selected significant mediator.

alpha_hat: coefficient estimates of exposure (X) \rightarrow mediators (M) (adjusted for covariates).

alpha_se: standard error for alpha.

beta_hat: coefficient estimates of mediators (M) \rightarrow outcome (Y) (adjusted for covariates and exposure).

beta_se: standard error for beta.

IDE: mediation (indirect) effect, i.e., $\alpha \cdot \beta$.

rimp: relative importance of the mediator.

pmax: joint raw p-value of selected significant mediator (based on HDMT pointwise FDR method).

MicrobiomeData

Compositional Mediator Dataset for HIMA Demo

Description

A dataset containing phenotype data and high-dimensional compositional mediators (e.g., microbiome). The dataset was simulated using parameters generated from real data.

Usage

```
MicrobiomeData
```

Format

A list with the following components:

PhenoData A data frame containing:

Treatment treated (value = 1) or not treated (value = 0).

Outcome a normally distributed continuous outcome variable.

Sex female (value = 1) or male (value = 0).

Age age of the participant.

Mediator A matrix of high-dimensional compositional mediators (rows: samples, columns: variables).

Examples

```

data(MicrobiomeData)
head(MicrobiomeData$PhenoData)

```

QuantileData

Quantile Mediation Dataset for HIMA Demo

Description

A dataset containing phenotype data and high-dimensional mediators for quantile mediation analysis. The dataset was simulated using parameters generated from real data.

Usage

```
QuantileData
```

Format

A list with the following components:

PhenoData A data frame containing:

Treatment treated (value = 1) or not treated (value = 0).

Outcome an abnormally distributed continuous outcome variable.

Sex female (value = 1) or male (value = 0).

Age age of the participant.

Mediator A matrix of high-dimensional mediators (rows: samples, columns: variables).

Examples

```
data(QuantileData)
head(QuantileData$PhenoData)
```

SurvivalData

Survival Outcome Dataset for HIMA Demo

Description

A dataset containing phenotype data and high-dimensional mediators for survival outcome analysis. The dataset was simulated using parameters generated from real data.

Usage

```
SurvivalData
```

Format

A list with the following components:

PhenoData A data frame containing:

Treatment treated (value = 1) or not treated (value = 0).

Status status indicator: dead (value = 1) or alive (value = 0).

Time time to the event or censoring.

Sex female (value = 1) or male (value = 0).

Age age of the participant.

Mediator A matrix of high-dimensional mediators (rows: samples, columns: variables).

Examples

```
data(SurvivalData)
head(SurvivalData$PhenoData)
```
